

Dart

Straight to the point. Hitting bull's eye every single time.

Google developed the open-source programming language Dart, which supports both client and server-side application development. Dart is extensively used for developing Android and iOS apps, Internet of Things (IoT) devices, and web applications using the Flutter framework.

Dart is a dynamically-typed, object-oriented programming language that shares similarities with Java, C, and JavaScript in terms of syntax. It supports closures and lexical scoping, making it a flexible language for a variety of use cases. Dart was first introduced in 2011, but gained popularity after the release of Dart 2.0 in 2015.
