

```
• main() {
• print("Welcome to My World");
• }
```

Output:

Welcome to My World

The `print()` function is predefined and prints the specified string or value to the standard input.

To execute the program, you can use an online compiler such as Dart Pad or an IDE like WebStorm, IntelliJ, or Eclipse. If you prefer the terminal, you can compile the Dart program by executing the code `"dart file_name.dart"`.

Understanding Comments in Dart

Comments are an essential component of every programming language as they facilitate better understanding of the code by future programmers. They are a set of statements that are not executed by the compiler and provide documentation of the code.

In Dart, there are three types of comments:

1. Single-line comment:

This comment is used to comment a single line of code until the line break occurs. It is denoted by two forward slashes (`//`).

Example:

```
• int main() {
• double area = 3.14 * 4 * 4;
• // It prints the area
• // of a circle of radius = 4
• print(area);
• return 0;
• }
```

Output:

50.24

2. Dart Multiline Comment:

In Dart, a Multiline comment is used to comment out a block of code that might include multiple lines. It is denoted by `/*` and `*/` to mark the beginning and the end of the comment, respectively.

`/*`

This is an example
