

Operators in Dart

Operators are symbols used to perform various operations on operands. Dart includes a wide range of built-in operators that can be used to perform different functions, such as adding two operands using the '+' operator. Operators are designed to operate on one or two operands.

Dart has several built-in operators that are represented by special symbols to perform specific operations on operands. The operators are categorized into the following types:

1. Arithmetic Operators
2. Relational Operators
3. Type Test Operators
4. Bitwise Operators
5. Assignment Operators
6. Logical Operators
7. Conditional Operator
8. Cascade Notation Operator

1. Arithmetic Operators

Arithmetic Operators are used to perform arithmetic operations on operands. They are binary operators, meaning they operate on two operands. The following table describes the symbols, names, and descriptions of the arithmetic operators in Dart:

- + | Addition | Adds two operands
- - | Subtraction | Subtracts two operands
- -expr | Unary Minus | Reverses the sign of the expression
- * | Multiplication | Multiplies two operands
- / | Division | Divides two operands
- ~/ | Integer Division | Divides two operands and returns the result as an integer
- % | Modulus | Returns the remainder of the division of two operands

```
• void main()
• {
•     int a = 2;
•     int b = 3;
•
•     // Adding a and b
•     var c = a + b;
•     print("Sum of a and b is $c");
• }
```
