

```

• // Subtracting a and b
• var d = a - b;
• print("The difference between a and b is $d");
•
• // Using unary minus
• var e = -d;
• print("The negation of difference between a and b
is $e");
•
• // Multiplication of a and b
• var f = a * b;
• print("The product of a and b is $f");
•
• // Division of a and b
• var g = b / a;
• print("The quotient of a and b is $g");
•
• // Using ~/ to divide a and b
• var h = b ~/ a;
• print("The quotient of a and b is $h");
•
• // Remainder of a and b
• var i = b % a;
• print("The remainder of a and b is $i");
• }

```

2. Relational Operators:

This class of operators contain those operators which are used to perform relational operation on the operands. It goes like this:

- > Greater than: Check which operand is bigger and give result as boolean expression.
- < Less than: Check which operand is smaller and give result as boolean expression.
- >= Greater than or equal to: Check which operand is greater or equal to each other and give result as boolean expression.
- <= less than equal to: Check which operand is less than or equal to each other and give result as boolean expression.
- == Equal to: Check whether the operand are equal to each other or not and give result as boolean expression.
- != Not Equal to: Check whether the operand are not equal to each other or not and give result as boolean expression.
