

```

• void main()
• {
•     int a = 2;
•     int b = 3;
•
•     // Greater between a and b
•     var c = a > b;
•     print("a is greater than b is $c");
•
•     // Smaller between a and b
•     var d = a < b;
•     print("a is smaller than b is $d");
•
•     // Greater than or equal to between a and b
•     var e = a >= b;
•     print("a is greater than b is $e");
•
•     // Less than or equal to between a and b
•     var f = a <= b;
•     print("a is smaller than b is $f");
•
•     // Equality between a and b
•     var g = b == a;
•     print("a and b are equal is $g");
•
•     // Unequality between a and b
•     var h = b != a;
•     print("a and b are not equal is $h");
• }

```

### 3. Type test operators

This is used to check the type of an object or variable. It includes the following:

- is is - Gives a boolean value of true if the object has a specific type.
- is! is not - Gives a boolean value of false if the object has a specific type.

```

• void main()
• {
•     String a = 'GFG';
•     double b = 3.3;
•
•     // Using is to compare

```
