

```

•   print(a is String);
•
•   // Using is! to compare
•   print(b is !int);
• }

```

4. Bitwise operators

This class of operators contain those operators which are used to perform bitwise operations on the operands. They work on individual bits of the operands.

- & Bitwise AND Performs bitwise AND operation on two operands.
- | Bitwise OR Performs bitwise OR operation on two operands.
- ^ Bitwise XOR Performs bitwise exclusive OR (XOR) operation on two operands.
- ~ Bitwise NOT Performs bitwise NOT operation on a single operand. It flips all bits of the operand.
- << Left Shift Shifts the bits of the first operand to the left by the number of positions specified by the second operand, inserting 0 bits from the right.

```

• void main()
• {
•     int a = 5;
•     int b = 7;
•
•     // Performing Bitwise AND on a and b
•     var c = a & b;
•     print(c);
•
•     // Performing Bitwise OR on a and b
•     var d = a | b;
•     print(d);
•
•     // Performing Bitwise XOR on a and b
•     var e = a ^ b;
•     print(e);
•
•     // Performing Bitwise NOT on a
•     var f = ~a;
•     print(f);
•
•     // Performing left shift on a
•     var g = a << b;

```
