

```

•   print(g);
•
•   // Performing right shift on a
•   var h = a >> b;
•   print(h);
• }

```

5. Assignment operators

This class of operators contains those operators that are used to assign values to the operands. The operators are:

- = Assignment Operator Used to assign values to the expression or variable.
- ??= Assignment Operator Assigns the value only if the operand is null.

```

• void main()
• {
•     int a = 5;
•     int b = 7;
•
•     // Assigning value to variable c
•     var c = a * b;
•     print(c);
•
•     // Assigning value to variable d
•     var d;
•     d ??= a + b; // Value is assign as it is null
•     print(d);
•     // Again trying to assign value to d
•     d ??= a - b; // Value is not assign as it is not
null
•     print(d);
• }

```

6. Logical operators

This class of operators contains those operators which are used to logically combine two or more conditions of the operands. The following are the different types of logical operators in Dart:

- && And Operator Used to combine two conditions and if both are true, it will return true.
- || Or Operator Used to combine two conditions and if even one of them is true, it will return true.
- ! Not Operator Used to reverse the result of the condition.
- void main()
