

```

• {
•     int a = 5;
•     int b = 7;
•
•     // Using And Operator
•     bool c = a > 10 && b < 10;
•     print(c);
•
•     // Using Or Operator
•     bool d = a > 10 || b < 10;
•     print(d);
•
•     // Using Not Operator
•     bool e = !(a > 10);
•     print(e);
• }

```

7. Conditional operators

This class of operators includes operators that perform conditional operations on the operands. It goes like this:

- `condition ? expression1 : expression2` Conditional Operator This is a simple version of the if-else statement. If the condition is true, then expression1 is executed, else expression2 is executed.
- `expression1 ?? expression2` Conditional Operator If expression1 is non-null, it returns its value; otherwise, it returns expression2 value.

```

• void main()
• {
•     int a = 5;
•     int b = 7;
•
•     // Conditional Statement
•     var c = (a < 10) ? "Statement is Correct, Geek" :
"Statement is Wrong, Geek";
•     print(c);
•
•     // Conditional statement
•     int n;
•     var d = n ?? "n has Null value";
•     print(d);
•
•     // After assigning value to n

```
