

```

•     n = 10;
•     d = n ?? "n has Null value";
•     print(d);
• }

```

8. Cascade notational operators

This class of operators allows you to chain a sequence of method invocations on the same object. It goes like this:

Cascade notation operator: It is used to perform multiple method invocations on the same object.

```

• class GFG {
•     var a;
•     var b;
•
•     void set(x, y)
•     {
•         this.a = x;
•         this.b = y;
•     }
•
•     void add()
•     {
•         var z = this.a + this.b;
•         print(z);
•     }
• }
•
• void main()
• {
•     // Creating objects of class GFG
•     GFG geek1 = new GFG();
•     GFG geek2 = new GFG();
•
•     // Without using Cascade Notation
•     geek1.set(1, 2);
•     geek1.add();
•
•     // Using Cascade Notation
•     geek2.set(3, 4)
•         ..add();
• }

```
