

Corona

Only the name sounds scary, in reality,
it is easy

Corona Labs, formerly known as Anscas Mobile, is a software company that developed a cross-platform mobile development framework called Corona SDK. The framework allows developers to build native apps for iOS, Android, Amazon Kindle, Windows Phone, tvOS, Android TV, and Mac and Windows desktops from a single codebase.

The Corona SDK is built on top of the Lua programming language, a lightweight and easy-to-learn language that is widely used for game development. Lua is a scripting language that was designed to be embedded in other applications, making it an ideal choice for Corona SDK's needs.

In this chapter, we will explore the basics of the Lua programming language and how it is used within the Corona SDK framework.
