

Issue: Your computer is running slow and taking a long time to complete even basic tasks like opening a browser or launching an application

You suspect that the issue could be related to a problem with the RAM (Random Access Memory) module. Based on this, here's the solution.

First, check how much RAM is installed on your computer and if it is sufficient for your usage. If not, consider upgrading your RAM module. If your RAM is sufficient, try removing the RAM module and reinserting it to ensure it is securely in place. You can also try cleaning the RAM module and its slot with a soft brush or compressed air. If the problem persists, run a memory diagnostic tool to check for any issues with the RAM module. If the tool detects any problems, replace the faulty module with a new one.

Following these steps will help you fix the issue in no time.
