

3. **Effectiveness:** Check to determine whether specific keywords have the intended impact on the generated photos.

Controlling the variability of image generation

To limit the variance in the pictures produced by Stable Diffusion, you can:

1. **Specify more in your prompt:** You can limit the range of possible responses to your question and lessen the variety in the resulting photographs by giving more detailed descriptions.
2. **Don't use too many keywords:** By restricting the AI model's options to a smaller number of possibilities, fewer keywords can assist to minimise the variety in the images that are produced.

Recognising the impact of association

Association effects happen when specific characteristics or components are closely associated in the comprehension of the AI model. These connections may have unforeseen effects on the visuals that are produced. To control the consequences of associations:

1. Plan your prompts in accordance with typical correlations, such as race and eye colour.
2. Use of names of celebrities or artists should be used with caution since they may imply unwanted connotations with postures, attire, or fashions.
3. To detect any unexpected association effects, test your prompts and then modify them as necessary.

Making Use of Custom Models and Embeddings

The style or look of produced pictures can be changed by using keyword combinations called embeddings. Although embeddings are designed to change particular characteristics of a picture, the nature of their underlying keywords may cause them to have unexpected consequences.

To utilise embeddings effectively:

1. Be aware of any potential unexpected consequences, such as modifications to the backdrop, subject stance, or other aspects of the photograph.

2. To understand the influence of your prompts on the images that are produced, test them both with and without embeddings.

AI models that have been customised for a particular activity or style are known as custom models. Custom models can make achieving a desired style easier, but it's important to keep in mind that when using a custom model, the meaning of some keywords or styles may change.

Customising the output

Customizing the technical settings of AI art generators requires a more advanced understanding of the specific model being used. Here are some general tips for customizing the technical settings while writing prompts for AI art generators:

1. **Contrast and brightness:** Use keywords that convey the desired level of contrast or brightness, such as "high contrast" or "soft lighting." Depending on the model, you may also be able to adjust these settings directly within the program.
2. **Saturation and vividness:** Similar to contrast and brightness, you can include keywords that specify the desired level of saturation or vividness, such as "pale colors" or "bold hues."
3. **Keyword strength:** Many AI art generators use keywords to generate the artwork, so adjusting the strength or relevance of the keywords can significantly impact the output. You can do this by adjusting the frequency of keywords used or including additional keywords that guide the model towards the desired style or subject matter.
4. **Detail and texture:** Some AI art generators allow you to adjust the level of detail or texture in the artwork. You can include descriptive words such as "textured" or "smooth" to guide the model towards the desired level of detail.

It's essential to note that the technical settings of AI art generators vary depending on the specific model being used. Some models may offer more options for customization than others, and the terminology used to describe the settings may differ. Experimentation and familiarity with the specific model are key to achieving the desired output.
