

Other keyboard maintenance tips to know

Here are some keyboard maintenance tips to keep your keyboard in good working condition:

1. **Clean your keyboard regularly:** Use a soft, lint-free cloth to wipe down your keyboard and remove dust and debris. You can also use a small brush to clean hard-to-reach areas.
2. **Avoid eating or drinking near your keyboard:** Food particles and liquids can damage the keyboard switches and circuitry.
3. **Use compressed air to remove debris:** Use a can of compressed air to remove debris and dust from your keyboard, especially around the keycaps and switches.
4. **Turn off your keyboard when not in use:** Turning off your keyboard when not in use can help prolong the lifespan of your keyboard and conserve energy.
5. **Keep your keyboard dry:** Avoid using your keyboard when your hands are wet, and keep it away from any sources of moisture.
6. **Replace worn-out keycaps:** If your keycaps are worn out or damaged, replace them promptly to prevent further damage to the switches and circuitry.
7. **Use a protective cover:** Consider using a protective cover to keep your keyboard safe from spills, dust, and debris.

By following these keyboard maintenance tips, you can keep your keyboard working correctly for an extended period and avoid costly repairs or replacements.

How to fix a broken keyboard?

A broken keyboard can be frustrating, especially if you rely on it for work or gaming. But before you throw it out and buy a new one, there are several things you can do to fix a broken keyboard.

In this section, we'll go over some common keyboard issues and how to fix them, from software problems to hardware issues. So let's get started.

1. Check your keyboard connection

The first thing you should do if your keyboard isn't working is to check its connection. If you're using a wired keyboard, make sure it's properly plugged into your computer's USB port. If you're using a wireless keyboard, check that it's properly connected to your computer via Bluetooth or the USB receiver.

If you're using a USB hub, try plugging your keyboard directly into your computer instead. Sometimes, USB hubs can cause connection issues, especially if they're low-quality or overloaded with devices.

2. Restart your computer

If your keyboard still isn't working, try restarting your computer. This can sometimes fix software glitches that are preventing your keyboard from working properly.

To restart your computer, click on the Windows Start menu, then click on the power icon and select Restart. Once your computer restarts, check if your keyboard is working again.

3. Check for driver updates

If your keyboard is still not working, you may need to update its drivers. Drivers are software programs that allow your computer to communicate with your keyboard and other hardware devices.

To check for driver updates, go to your computer manufacturer's website and look for the latest drivers for your keyboard. Download and install the latest drivers, then restart your computer.

4. Clean your keyboard

Sometimes, your keyboard may stop working due to dust, debris, or dirt that has accumulated between the keys. To clean your keyboard, turn it off and unplug it from your computer.

Then, use a can of compressed air to blow out any dust or debris between the keys. You can also use a small brush to clean hard-to-reach areas.

If your keyboard is very dirty, you may need to remove the keycaps and clean them individually. To remove the keycaps, use a keycap puller or a small screwdriver to gently pry them off. Clean the keycaps with a soft cloth and warm soapy water, then let them dry completely before replacing them.

5. Replace broken keys

If some of your keys are broken or not working, you may need to replace them. You can usually buy replacement keycaps online or from your keyboard manufacturer.

To replace the keycaps, gently pry off the broken key with a keycap puller or a small screwdriver. Then, snap the new keycap into place.

If the key itself is broken, you may need to replace the entire keyboard or take it to a professional repair service.

6. Check for hardware issues

If your keyboard is still not working, there may be a hardware issue that needs to be addressed. Check that all the internal components, such as the switches and the Printed Circuit Board (PCB), are properly connected and not damaged.

If you're comfortable with electronics, you can try opening up your keyboard and checking for loose or damaged components. However, be aware that this can be dangerous and can void your warranty.

7. Use an external keyboard

If you've tried all of these steps and your keyboard still isn't working, you may need to use an external keyboard as a temporary solution. You can connect an external keyboard to your computer via USB or Bluetooth.

An external keyboard can be a good solution if you need to continue working or gaming while you figure out how to fix your broken keyboard. Before purchasing a new keyboard, make sure to read reviews and do your research to find one that fits your needs and budget.^[1]
