

# Something's Left

Last bits before we wrap up

---

**T**he advent of folding phones and big-screen devices marks a new era in mobile technology. Once, the trend was to make phones smaller and more compact. Now, the tide has turned, with screen size becoming a significant factor in the consumer's choice of device. From Samsung's Galaxy Z Fold series to Microsoft's Surface Duo, these devices aren't just a passing fad but represent the future of mobile technology. They offer users a larger, more immersive display while maintaining the portability of a smartphone.

App design plays a critical role in the user experience, especially for these new form factors. As screen sizes grow and become more versatile, apps need to evolve to make full use of the available space. A design that works on a conventional smartphone screen might not translate well to a foldable or big-screen device. The layout, user interface, and even the functionality might need to be rethought to suit these new form factors.

In this chapter, we will delve deep into the design philosophies and considerations that make an app suitable for big screens and folding phones. We'll discuss the specific design elements needed and how they contribute to a seamless and engaging user experience. Whether you're an app developer looking to optimize your app for these new devices or a curious tech enthusiast, this article will provide valuable insights into the world of app design for big-screen and folding phones. So, let's unfold the future of app design together.

## Understanding folding phones and big screens

In an ever-evolving technological landscape, the emergence of folding phones and large-screen devices marks a significant shift in the way we interact with mobile technology. As these new form factors gain traction, it's crucial to understand their
