

Creating and formatting content

Making it all look pretty and readable

Crafting content in Notion goes beyond mere text input. It's an extensive endeavor that encompasses markdown formatting, multimedia embedding, code integration, and usage of advanced blocks for a dynamic content presentation. This chapter aims to provide a thorough exploration of these elements, furnishing you with the knowledge needed to create, format, and organize content proficiently in Notion.

Text formatting: Markdown, Code Blocks, Inline Equations

Notion provides a rich text editing experience through markdown, code blocks, and inline equations.

Markdown:

Markdown is a text-to-HTML conversion tool enabling plain text formatting.

- Bold (**text**), Italics (*text*), Headings (# H1, ## H2), Lists (- item or 1. item), and more can be created swiftly.
- Notion automatically recognizes markdown syntax as you type, converting it to rich text.

Code Blocks:

- Create a code block by typing ````` (three backticks) and then hit 'Enter'.
- Code blocks support syntax highlighting for multiple programming languages, enhancing readability.
