

Creating complex database structures:

Complex database structures are pivotal for handling intricate projects or data sets.

Nested Databases: Create databases within databases to handle multi-dimensional data. For example, have a database of projects, each with its own nested database of tasks.

Database Templates: Utilize templates to swiftly create new entries with a predefined structure. For example, create a project template with predefined properties and nested databases.

Building dynamic Dashboards and Project Management Boards:

Dashboards and boards are vital for project management and data visualization.

Kanban Boards: Utilize the board view to create a Kanban board for task management. Customize the status options and drag and drop tasks between columns.

Dashboards: Create dynamic dashboards using linked databases, charts, and other visualization blocks. For example, build a project dashboard showing tasks, deadlines, and project status.

Data Linking Between Databases:

Linking data across databases enables a centralized data management system.

Database Relations:

- Establish relations between databases to cross-reference data.

- Utilize roll-up fields to pull in related data from other databases.

Linked Views:

- Create linked views to display data from one database in another, applying different filters or sorting options.

Advanced Filtering, Sorting, and Views:

Notion provides an array of options for filtering, sorting, and viewing data.

Filtering:

- Apply filters to your database to narrow down the data shown based on certain criteria.
- For example, filter tasks to only show those due in the next week.

Sorting:

- Sort your database based on one or more properties to order the data in a way that suits your needs.
- For example, sort tasks by priority and then by due date.

Custom Views:

- Create different views (table, board, list, calendar, gallery) to visualize your data in various ways.
- Customize each view with specific filters, sorting options, and display properties to suit different needs.

Additional Database Tips & Tricks:

Your database knowledge isn't complete without understanding permissions and widgets, maintenance related backup and automation tasks within Notion's repertoire as mentioned below.
