

Notion templates and customization

Making a set format

One of Notion's standout features is its ability to create templates and customize them to suit personal or team-based needs. This functionality significantly accelerates content creation, ensures consistency across data entries, and provides a platform for team collaboration. This chapter delves into the process of creating custom templates, styling them with advanced layout techniques, the collaborative process involved in template creation and sharing, and the exploration of advanced templates for various use cases.

Creating Custom Templates:

Custom templates are a cornerstone of efficient and consistent content creation within Notion.

Creating a Template:

- Navigate to the desired database or page where you wish to create a template.
- Click on the "Templates" button located at the top right, followed by "New Template."
- Assign a name to your template and start designing it by adding the necessary properties and content.

Utilizing Advanced Properties:

- Incorporate relational databases, formula fields, and roll-up fields within your template to create complex data structures.
- Predefine tags, multi-select properties, or even person fields to streamline the data entry process.
