

Preparing Your Device for AI

Essential setup for running AI efficiently on personal devices

To unleash the full potential of AI on your personal devices, it's crucial to ensure that your hardware and software are adequately prepared. This chapter will guide you through the necessary steps to get your devices ready for running AI applications locally. We will cover the hardware requirements, essential software and tools, and setting up a development environment.

Hardware Requirements for Running AI Locally

Running AI applications locally can be resource-intensive,

requiring a robust hardware setup. Here's what you need to consider:

1. CPU (Central Processing Unit)

The CPU is the brain of your computer. For basic AI tasks, a multi-core processor with high clock speeds will suffice. However, for more com-
