

Writing Your First JavaScript Program

Now that you have a basic understanding of JavaScript syntax, let's write a simple program that interacts with the user and manipulates the DOM (Document Object Model).

1. Create an HTML File:

- Create a new file named `index.html`.
- Add the basic HTML structure and link to your JavaScript file.

```
<!DOCTYPE html>
<html lang="en">
<head>
    <meta charset="UTF-8">
    <meta name="viewport"
content="width=device-width, initial-
scale=1.0">
    <title>JavaScript Program</
title>
</head>
<body>
    <h1 id="greeting">Hello,
World!</h1>
    <button
id="changeTextButton">Change Text</button>
    <script src="script.js"></
```

```
script>
```

</body>

</html>

2. Create a JavaScript File:

- Create a new file named `script.js`.

3. Write the JavaScript Code:

- Select the button and the heading elements from the DOM.
- Add an event listener to the button to change the text of the heading when clicked.

```
// Select the elements
const greeting = document.
getElementById('greeting');
const button = document.getElementById('c
hangeTextButton');

// Function to change the text
function changeText() {
    greeting.textContent = "Text
Changed!";
}

// Add event listener to the button
button.addEventListener('click', change-
Text);
```
