This is a
multi-line comment
*/
```

Control Structures:

C++ supports control structures like conditionals and loops.

```
#include <iostream>

int main() {
    int age = 18;

    // Conditional
    if (age >= 18) {
        std::cout << "You are an adult."
<< std::endl;
    } else {
        std::cout << "You are a minor."
<< std::endl;
    }

    // Loop
    for (int i = 0; i < 5; i++) {
        std::cout << "Iteration: " << i
<< std::endl;
    }

    return 0;
}
```

Functions:

Functions in C++ are defined using the `return_type function_name(parameters)` syntax and can return a value.

```
#include <iostream>

// Function declaration
int add(int a, int b) {
    return a + b;
}

int main() {
    int sum = add(3, 4);
    std::cout << "Sum: " << sum << std::endl;
    return 0;
}
```

Classes and Objects:

C++ is an object-oriented language, meaning it revolves around objects and classes.

```
#include <iostream>
```

```
// Define a class
class Person {
public:
    std::string name;
    int age;

    // Constructor
    Person(std::string name, int age) {
        this->name = name;
        this->age = age;
    }

    // Method
    void display() {
        std::cout << "Name: " << name <<
        ", Age: " << age << std::endl;
    }
};

int main() {
    // Create an object
    Person person("Alice", 30);
    person.display();

    return 0;
}
```

Writing Your First C++ Program

Let's write a simple C++ program that asks the user for their name and age, then displays a greeting message and calculates the year they were born.

1. Create a New Project:

- Open your chosen IDE (e.g., Visual Studio, CLion).
- Create a new project and select a C++ console application template.

2. Write the C++ Code:

- Open the main.cpp file and enter the following code:
