

```
// Conditional
if ($age >= 18) {
    echo "You are an adult.";
} else {
    echo "You are a minor.";
}

// Loop
for ($i = 0; $i < 5; $i++) {
    echo $i;
}
?>
```

Functions:

Functions in PHP are defined using the `function` keyword and can return a value.

```
<?php
function greet($name) {
    return "Hello, " . $name . "!";
}

echo greet("Alice");
?>
```

Arrays:

Arrays in PHP can be indexed or associative.

```
<?php
// Indexed array
$numbers = array(1, 2, 3, 4, 5);
echo $numbers[0]; // Outputs: 1

// Associative array
$person = array("name" => "Alice", "age"
=> 25);
echo $person["name"]; // Outputs: Alice
?>
```

Writing Your First PHP Program

Let's write a simple PHP program that asks the user for their name and age, then calculates the year they were born.

1. Create Project Structure:

- Create a directory named `my_php_app` inside your web server's root directory ([htdocs](#) for XAMPP).

2. Create a PHP File:

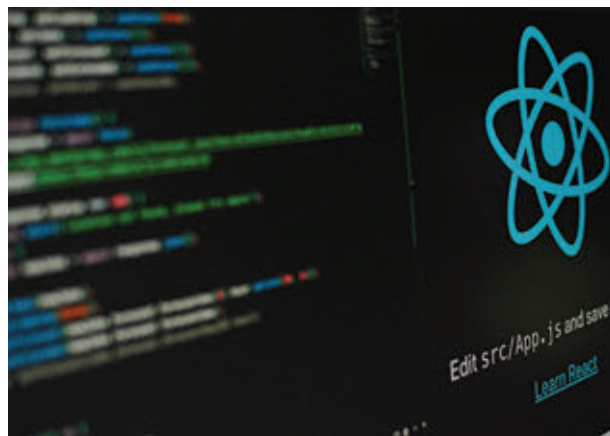

- Inside the `my_php_app` directory, create a file named `index.php`.

3. Write the PHP Code:

```
<?php
if ($_SERVER["REQUEST_METHOD"] == "POST") {
```

```
$name = $_POST["name"];
$age = $_POST["age"];
$current_year = date("Y");
$birth_year = $current_year - $age;
echo "Hello, $name! You were born in
$birth_year.";
}
?>

<!DOCTYPE html>
<html lang="en">
<head>
    <meta charset="UTF-8">
    <title>Age Calculator</title>
</head>
<body>
    <form method="post" action="<?php echo
$_SERVER['PHP_SELF']; ?>">
        <label for="name">Name:</label>
        <input type="text" id="name"
name="name" required><br><br>
        <label for="age">Age:</label>
        <input type="number" id="age"
name="age" required><br><br>
        <input type="submit" value="Submit">
    </form>
</body>
</html>
```

4. Run the Application:

- Open your web browser and navigate to `http://localhost/my_php_app/index.php`.
- Enter your name and age, and submit the form to see the result.

Industry Trends and Applications

PHP remains a cornerstone of web development due to its
