

TVs

Maximum entertainment, guaranteed!

4K Ultra HD (UHD)

4K Ultra HD refers to a resolution of 3840 x 2160 pixels, offering four times the pixel count of Full HD (1920 x 1080). This higher resolution results in sharper images and finer details, enhancing the viewing experience, especially on larger screens. As streaming services increasingly adopt 4K content, having a 4K TV allows viewers to enjoy their favorite shows and movies in superior quality.

HDR (High Dynamic Range)

HDR technology enhances the contrast and color range of a display, providing a more realistic and vibrant image. It allows TVs to display brighter highlights and deeper blacks, improving the overall picture quality. HDR content is becoming more prevalent on streaming platforms, making HDR-capable TVs a preferred choice for cinephiles seeking a cinematic experience at home.

OLED (Organic Light Emitting Diode)

OLED TVs use organic compounds that emit light when an electric current passes through them. This technology allows for true blacks and excellent color accuracy, as each pixel can be turned on or off individually. OLED displays offer superior viewing angles and response times, making them ideal for dark environments where picture quality is paramount, such as home theaters.

LED (Light Emitting Diode)

LED TVs use LED backlighting to illuminate the LCD screen. They are more energy-efficient than traditional LCDs and can provide brighter images. Variants like Full-Array and Edge-Lit LED enhance contrast and uniformity. LED TVs are widely available and suitable for various viewing environments, making them a popular choice among consumers looking for value and performance.
