STORAGE

Binning

Binning is the practice of sorting and categorizing storage devices based on their performance characteristics and reliability. Manufacturers often test drives to determine their quality and longevity before labeling them for sale. Enthusiasts who are interested in high-performance drives may look for higher-binned parts, which are guaranteed to perform better under heavy workloads.

Clone Software

Clone software is used to create an exact copy of a storage device, including the operating system, applications, and data. This is especially useful when migrating from an HDD to an SSD. Enthusiasts use clone software to ensure a seamless transi-

tion without reinstalling applications, preserving settings, and maintaining data integrity during upgrades.

Cold Storage

Cold storage refers to the practice of storing data on HDDs or SSDs that are not frequently accessed. This is commonly used for archival purposes. Enthusiasts use cold storage to save costs on long-term data retention, as HDDs generally offer more storage capacity at a lower price compared to SSDs. This practice is particularly useful for businesses and individuals needing to keep large amounts of data for compliance or future reference.

Encryption

Encryption secures data on storage devices by converting it into a format that unauthorized users cannot read. Both SSDs and HDDs can implement hardware or software encryption methods
