

IE7 Releases

After nearly a year in Beta, Microsoft has finally announced the release of IE7 Final for Windows XP SP2 and 2003. Now, will it match up to the competition? Or will this just turn into another race for hackers to find new bugs and security holes? Let's wait and watch!

Windows Virus On iPods

A small number of iPods have shipped with the RavMonE virus, triggering an "It's your fault" battle between Apple and Microsoft. Windows is not secure enough, it seems, and Apple doesn't check its products properly... Oh well, just another day in technology!

Krishna Mehta

Fashion Designer

Krishna Mehta is a noted fashion designer, having taken the Indian fashion industry by storm in 1991 with her menswear. Her designs are known for their understated elegance, relaxed, yet bold.

Technology is...

Like a lifeline. I can compare it with

oxygen—one can't survive without it. Every day I feel I'm getting more dependant on tech. I like new technologies, and am fascinated by the changes they bring about in our lives.

What gadgets do you use?

A Nokia Communicator, a laptop with a data card, a desktop PC at home that runs my CAD. I like to change my mobile with every new model that comes into the market.

What's your dream gadget?

A robot! I want one that will do everything I tell it to.

What do you do online?

I do zillions of things when I go online. I go online if I want to find information about a product. When I travel, I look up weather forecasts. I check for dates of fashion fairs happening around the world, and even to check out colour palettes.

Has technology ever come to your rescue?

Like I said earlier, technology is like a lifeline for me. There has not been a particular instance when it has come to my rescue; it has always been with me whenever I need it. I cannot live without tech!

QUAD WARS

Intel Launches, AMD Fumes

While the world still comes to terms with the humongous performance of the Core 2 Duo, the processor giant waits to strike yet another blow to rival AMD—by mid-November, we'll be seeing

programmers, multimedia content creators and generally anyone who needs the powerhouse backing them. How tall are these claims? Find out in our CPU test later in this issue!

Meanwhile, AMD has revealed their architecture

jumping the gun, and we'll be reserving our judgement till we've had a chance to pit them against each other. AMD targets a 2007 release for the Barcelona—risky, considering that Intel will have led the performance segment for more than three months.

The bigger question still lurks, though—do you really need so much power? Sure, it'll be manna for hungry gamers and multimedia users, but does Average Joe, who has all he needs in a single-core processor, benefit from any of this?

SCOUT'S HONOUR

"We Won't Sue You"

As it turns out, the Firefox team didn't meet with an "unfortunate accident" during their visit to Redmond earlier this year, so we're going to put our pessimistic selves aside and take it at face value—Microsoft has indeed found a place its heart for the Open Source Movement. This time, it's their Open Specification Promise (OSP) that has earned them a pat on the back from the industry. The said document states that Microsoft will not sue anyone who chooses to create software based on their Web services

the first desktop PCs to be powered by Intel's new quad-core processors. Intel has announced its tie-up with HP for the launch, and they will both host "Quad Fest" on November 13, 2006, to promote the PCs.

Intel claims that the processors will increase application performance by 70 per cent, making the chip ideal for gamers,

for the "Barcelona" quad-core processor, claiming it to be better than Intel's. The main difference between the two is that AMD sports a true-blue quad-core design—with all four cores on the same die—while Intel's version is little more than two Core 2 dies squashed together. Still, comparing the two at this early hour would be
