

which lets you go a few levels behind in the Web site you are currently browsing. For example, if you are browsing <http://www.forums.com/forums/search.php> then by using the “One Level Up” function, you can move back to <http://www.forums.com/forums> and <http://www.forums.com>, even if you hadn’t gone to those pages before. There are still a few goodies in this add-on, but we’ll let you find them out for yourself.

Video Download by Vloader

Not what the title indicates, Video Download is not your generic download manager for videos. How often have you wished to grab files from sites like YouTube, Google Video, etc., which don’t provide you with the option to save the video files to your PC? Sure, you can hunt them down by going into your Temporary Internet Files, but using the Video Download add-on for IE7 is more practical, since it lets you instantly save these videos to your hard drive. The downloaded video files will turn out to be .flv video files, from which you can convert to AVI using most converter software.

IE Spell

You know you need one of these! The spell check function has become the bread and butter of apps like Microsoft Office, and we guarantee there was a time when you wished it would be implemented even in browsers. IE Spell fulfills this exact wish by providing you with a spell check for your Web mail, blogs, diaries, forms—you name it. If it can be typed, it can be spell-checked. This is one of the most useful add-ons for those who write a lot of content on the Web. No need to type your stuff in a Word document; spell check and then copy paste to your browser. You can do it on-the-fly with IE Spell!

IOSurf

Chat addicts will instantly fall in love with IOSurf, an add-on that takes online communica-

tion to its limits...literally! IOSurf allows multiple users viewing the same Web page to chat with each other (provided all users have IOSurf installed, of course). You can group-chat with all users viewing the Web page or select a specific user and chat with him/her. What’s more, IOSurf doesn’t compromise on security: all messages are sent using SSL (Secure Shell Layer) encryption to keep them safe from prying eyes.

C No Evil Toolbar

C No Evil Toolbar stands up to its name rather cleverly. The “Evil” here pertains to the annoying advertisements and banners you often see on Web pages. While you would normally curse at the very sight of banners, C No Evil will keep your curses, expletives and umm... karma in check by replacing the advertisements with your own personalised images of just about anyone and anything as long as it’s an image or a gif animation. The strange thing is that after installing this add-on, you will be looking at sites heavily filled with ads in a more positive light just because you will be showered with pictures of your favourite actress in the place of those pesky banners!

Error Buddy

How much do you hate 404 error pages? With Error Buddy, you can get rid of those bland messages and replace them with Error Buddy pages which give you news, the joke of the day, and so on, while, of course, informing you that the site you were trying to visit is down. What’s more, every time you visit an invalid URL and end up at Error Buddy’s page, you will actually be contributing for charity foundations—talk about good deeds for bad links! A note of warning though—intentionally going to the dead link too many times can get you banned from www.errorbuddy.com.

Useful Stuff 123 Toolbar

You will often find Useful Stuff Toolbar almost as handy as a Swiss Army Knife. This add-on is a package containing a bunch of features, including a history and cache cleaner, POP3 and Yahoo! mail checker, and search bars for several search engines, in addition to other nifty features like weather and time for your area. The Useful Stuff 123 toolbar lives up to its name, this should definitely be one of the first add-ons you should install as soon as you get your hands on IE7.

Notefish

Serious Internet researchers will find themselves heavily dependent on Notefish, a nifty tool for researching on the big bad Internet. Notefish allows you to save snippets of Web pages with something as simple as a drag, select and “copy to”. In a way, this resembles cutting off snippets from newspapers or magazines and saving them in a separate project file. Images, text, entire HTML pages or even portions of them—if you can select it, you can snip it and
