

F-Secure Internet Security 2007

Feel Secure

An anti-virus, firewall, spam control and parental control are all part of this easy-to-use complete security solution.

Installation begins with the user being prompted with an option for a pre-install scan. After rebooting for the first time, an optional profile Wizard can be run to allot passwords, which will later be useful for parental control.

The interface is not the cleanest, but there are advanced options for the user to fine-tune the suite.

Based on rules set up in the profile Wizard, the parental control filters allow access to specific sites deemed suitable for children. A time scheduler further restricts online activity during a predefined time of day.

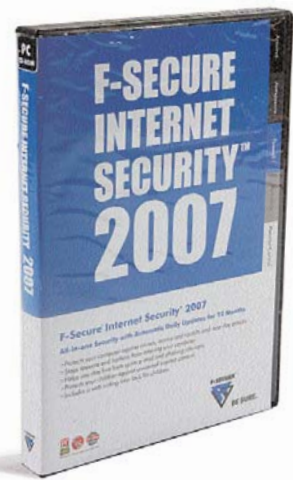

In case of more than one network being used by your computer, your home network adapter, for example, can be set as "trusted," and free, uninterrupted access will be allowed to all programs. Even Internet traffic is scanned for malicious code.

The virus scanner itself is pretty light, and the scanning uses moderate processor power. Spam control works hand-in-hand with your mail clients to ensure you don't have spam mails clogging your inbox. Detailed reports of the virus and spyware scan are generated as HTML files.

Updating the suite is automated. 21 MB was downloaded during our initial attempt at updating the suite.

No printed documentation is provided, but an electronic manual is available once the suite is installed. An attractive Flash-based tutorial is available on the Internet to guide the user. There's even a link to an F-Secure site, with a map of the world with statistics and patterns of virus and worm spread.

The installer CD doubles up as the emergency disc, and boots up a Linux-based anti-virus scan, which can help clean out viruses in case of a serious system crash. Changes in BIOS might be required to make SATA hard drives detect properly

The suite has everything one would need for securing one's PC. Rs. 1,600 for up to three users is pretty good value for money considering all the features.

GoToMyPC

Remotely Connected

GoToMyPC is a service that lets users remotely access computers over the Internet. After registration, the service requires you to log in into your account at the GoToMyPC site, www.gotomypc.com. The next few steps involve installing a small host program on your desired machine.

The user can access the host by using the default Windows application, which automatically downloads itself to your computer when you choose to connect to a host. A Web-based client called Universal Viewer, which is a Java applet, is also available for those with no privileges to run executables, or if they are at a public terminal.

What makes GoToMyPC special is that you can sync files and folders between laptop and home

PC on the move. Also included is access to printers and sound from the host PC, so you can listen to audio being played on the other end. You can even chat with the person on the other end. Guest users can be invited to share a session on a remote machine.

The host machine could be accessed even when it used a proxy server to access the Internet. Basic performance tweaks such as reducing colour depth and disabling wallpapers are available to help improve slowdowns on a slow connection. The data sent and received is through the GoToMyPC servers, so some delay is evident. The connection doesn't require much bandwidth; it worked pretty well even on a 256 Kbps connection, with transfer speeds peaking at 10 to 12 KBps.

Control and data transfers are encrypted with 128-bit AES to prevent data being sniffed. In addition to the standard login and password combination, there's a set of security checks called

one-time passwords. Users not wanting any of the file transfers and sound features will be better off using VNC where possible.

You shell out Rs. 8,250 for a year's access to this service for a single PC, which is pretty high in our opinion.
