

Ingredients

To start with, you're going to need a PC of modest configuration. Even a Pentium II with 128 MB of RAM will work for a team of up to twenty people; you'll need to consider something higher for bigger teams. If it's got a motherboard that supports SATA hard disks, so much the better. A USB Flash drive is optional (we'll get to that in a bit), and you'll need hard disks—as many as your board can support, or as many as you want, whichever is lesser. On this month's DVD, you'll find FreeNAS—a FreeBSD-based operating system built to manage your NAS server. Burn the ISO on to a CD and boot from it to start setting up your NAS server.

Setting Up

Installing FreeNAS to your system is optional—it'll do its job just as well running off the CD, but remember that every time you reboot, you'll need to reconfigure the server all over again. You can't format or share any hard drive you install FreeNAS on, so we recommend installing it to a USB Flash drive instead (be sure

The FreeNAS Web interface—your command centre

to first check whether your motherboard supports booting off USB). The installation is a no-brainer (just remember that your USB disk will be called "da0"), and in a couple of minutes, you'll find yourself being told to eject the CD-ROM and reboot. Now that it's installed, you can consider disconnecting your CD-ROM drive to make room for another hard disk.

When you boot into your new FreeNAS installation, you'll see a very simple console menu. All you need to bother with here is to assign an IP address and subnet mask to this server to get it on your network; your work with

Add your disks before anything else
