Mars Hotels and Restaurants
Pvt Ltd

We have deployed security solutions in keeping with our budget, requirements, and nature of business. All our Desktops have McAfee's anti-virus software installed, and we've also deployed SonicWALL firewall. That acts as the Intrusion Detection System. The best feature of SonicWALL is the option of multi-Ethernet connections, which isn't found in any other firewall.

McAfee's ePolicy Orchestrator auto-updates virus definitions and sends them to connected machines, and the Microsoft Windows Security Update Service downloads the latest security patches and pushes them to all the machines. We use Netcore's mail solution—which keeps out spam and phishing mails.

Constant monitoring of the network security is done through a single console, and reports from the logs generated are automatically sent to pre-defined users. After deploying our security solutions, we've enjoyed high protection from viruses and better bandwidth management.

CAUSE FOR

We're increasingly seeing companies of all kinds becoming aware of security issues. What are they doing about it? Some outsource, some see internal users as the biggest threat... these and other viewpoints discussed

Rajesh Krishnappa
Principal IT engineer
FCG Software Services India
Pvt Ltd

Every company has a wide variety of diverse network components that have an effect on security—users, firewalls, and network topologies. The various security tools in the market are worth investing in if they have a substantial ROI.

Security programs and services are designed to meet the needs of small and medium businesses—basically to reduce costs, improve productivity, and protect data. By deploying a well-designed firewall along with DMZ (De-Materialized Zone, to host all Web-based applications), Desktop anti-virus, and operating system patch updates—apart from implementing freeware tools like Snort and Nesses—we can find and fix vulnerabilities in the network.

Each company has its own network infrastructure, security policies, and tools for managing security. How you seamlessly integrate these acquisitions into your company and still keep all IT assets secure should be part of your IT security project plan.

An easy way to begin looking at network security is via the well-known CIA (Confidentiality, Integrity, and Availability). Nearly 80 per cent of the threat is from internal users; keeping this in mind, we can plan accordingly to keep our business secure.
