

Falgun Shukla
Sr Gen. Manager IT
Hikal Ltd

Security of data and the network is crucial for any business, irrelevant of size. At Hikal Ltd, we have deployed security solutions at the Desktop, Network, and Service Provider levels. For the Desktop level, we've been using three levels of security—McAfee's AntiVirus software, special data-encryption software, and user authentication for accessing any machine and the Internet. This is necessary to ensure security at the internal level.

At the network level, we use a proxy server for converged Internet access. We have outsourced our mail solution to IBM and about 60 per cent of spam as well as infected and phishing mails are blocked. We're thus able to save our network resources, and this also means time saved for senior management. Outsourcing means no efforts are required on our part to monitor and manage security—important, because getting people with multi-faceted skills to manage all IT needs is very difficult. We believe that other businesses should outsource their security solutions such as mail systems and choose products / services specialised for their security needs.

K. Ramaswamy
M. I. S. Manager
The Ruby Mills Ltd

The security solutions deployed at The Ruby Mills are in a three-tier mode for both e-mail and storage devices. A Unified Threat Management appliance (UTM) has been deployed, and there is also Kaspersky anti-virus at the gateway. At the Desktop and server level, McAfee's TOPS managed services—virus scans, spyware protection, and inbuilt intrusion protection—work round the clock.

The UTM package installed also provides intrusion detection, protection against spyware, and content filtering. SonicWALL ViewPoint is a good reporting server for monitoring and reporting content accessed on the Web. All security-related events regarding contents of Web access and e-mails are reported to the server, which is monitored. Access to the Web is done through authenticated user login.

All enterprises should adopt security measures with defined security policies. Windows Domain functionality is useful—you can have three security levels for user access. A business enterprise should evaluate their needs and then deploy solutions from scratch.

Sanjeev Raiphale
Kipa Architects

Our IT requirements are fairly limited. Only basic computer systems are required at our office. We use Quick Heal's anti-virus solution for the Desktops. All systems undergo regular scanning for viruses and Trojans. We have outsourced our IT security services.

Reports and logs of the scanning are maintained. So far, we've never had a problem with the security of our network or data. Still, we always look to keep our systems protected from virus attacks and spam. The biggest threat today in terms of security is from internal resources. However, outsourcing our security needs helps us stay protected against virus attacks and we can concentrate on our business.
