

An Inside View

We were privileged to have been invited to this event; more than sixty media representatives from around the world participated, including the likes of Tom's, HardOCP, PC Stats, and TweakTown. This three-day event was in Shanghai, and we got to visit MSI's sprawling factory in the Kunshan region. It comprises two manufacturing buildings (M1 and M2) and one very large R&D centre. At M1, we looked at how MSI manufactures motherboards, and at M2, how they assemble notebooks

MSI's X38 With A New Circu-pipe Design

On the trip, we got to see new MSI products that should hit the market within the next two months. The X38 chipset-based motherboard will be out in October, and it will be packed with features beyond your wildest imaginations. Newer VGA cards that support HDMI—from both ATI and NVIDIA—are in the pipeline.

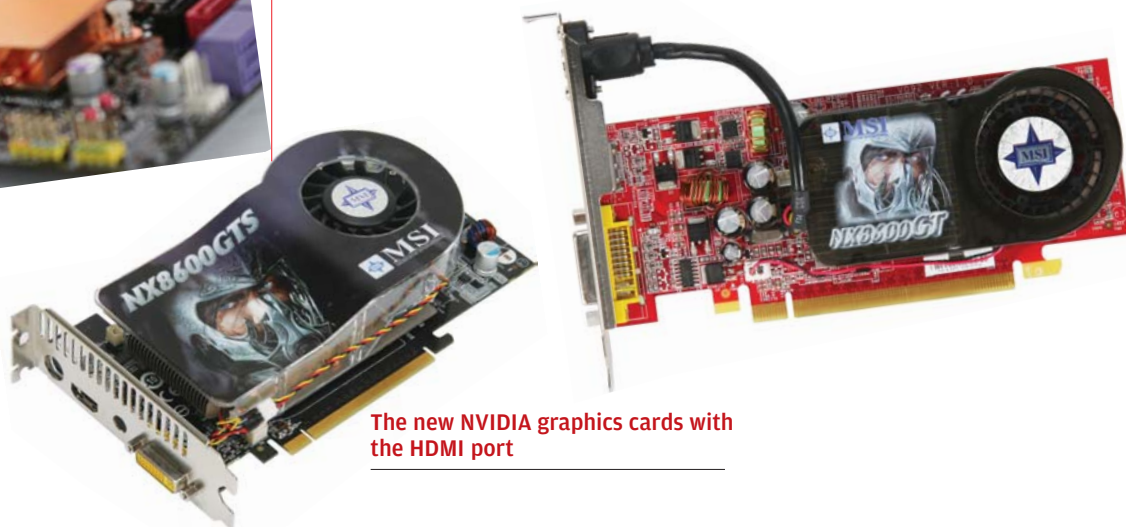

What We Saw Is What You Get!
MSI Media Tour 2007

The GX-600: Overclock This!

What MSI was most elated about was their new gaming notebook, the GX600 (and its variants). It has a "TURBO" button for overclocking the processor; however, it doesn't overclock the VGA card—sort of lame considering it's a gaming notebook. We got to play with it and enjoyed a round of *F.E.A.R.*—it looked good, though we can only pronounce a verdict once we review the notebook. Still, we must say that we hope MSI introduces the notebook in India!
