Busting More Myths

Larger Megapixel = Better camera? Not always the case. All the visual data recorded on a digital camera comes from the sensor. The non-DSLR cameras we see have a much smaller sensor as compared to the ones on an SLR. So a 5MP D-SLR's CMOS is actually much better than a 5MP CCD sensor of point-and-shoot cameras.

Increasing megapixels don't mean the sensor size has increased as well.

For a fixed sensor size, megapixel ratings can change!

The other confusion is regarding the resolution increase of the image if you increase the megapixel value. Megapixels are used to measure the number of pixels: 1 megapixel = 1,000,000 pixels (1000 x 1000 pixels). The only improvement you're going to find is the marginal increase to the width and height of the image.

So if you see a camera with a higher megapixel rating than yours, don't think of it as a huge improvement in quality.
