

Kee to Pass!

Adding one more to the list of attacks security attacks this year is KeeFarce. <http://dgit.in/Keefarce>

New Router Launched

Digisol launched a new router at a street friendly price. Read on for other specification details. <http://dgit.in/Digisol>

Honor 7

A honourable phone

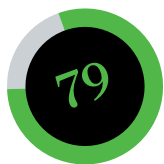

The build of the Honor 7 is premium and very good. The good old candy bar form factor combined with the aluminium build makes the device not only look premium but feel premium as well – which is quite an achievement given the device's price point. The smartphone has the Emotion UI 3.1 and it lists icons on the home page like iOS and doesn't house an app drawer. The UI is customizable which means that you can have a variety of themes and skins on it. Overall, the performance of the smartphone is very smooth. The fingerprint scanner works brilliantly, as good as the Nexus Imprint – which was a pleasant revelation. You can also use the fingerprint scanner to bring down the notifications menu and enable other shortcuts.

Price
₹22,999

When it comes to calling, it just works and that's a very good thing. The volume isn't too loud even at full volume. The smartphone has an IR blaster that works well with universal remote apps. Coming to other everyday use like reading text, browsing the web, social media, and more it worked well. The battery life of the smartphone is good too lasting one day of heavy use. A flash accompanies both the cameras. The rear camera takes some brilliant shots in well-lit conditions. In low-lit conditions, you will see a notification, which says processing and its worth the 1 second wait as the images produced are really good. All things considered, this is a very good handset for all those who don't want to join the OnePlus line.

Swans HiVi M100 MKII

Precision and modern day connectivity

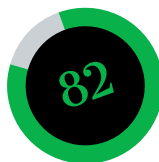

Unlike traditional reference monitors the Swans HiVi M100MKII comes with bluetooth connectivity. To purists that might seem like a travesty, what with the reduced data rate of the protocol and all, but guess what; while there was a difference in quality it wasn't unbearable. I played the same flacs from the Essense STX and via Bluetooth from a Nexus 5. The drop in detail was subtle, for instance the cymbals were more vibrant via the STX but overall it felt like the changes were on account of a DSP that got applied. Net take away is that if your non-audiophile friends pair their phones, the speakers

will reproduce better audio than they would normally be accustomed to.

How do they perform otherwise? The clarity is quite impressive and I was especially impressed with the dynamic range. The speaker set performed particularly well on pinch harmonics with some of our guitar driven test tracks. For bass heavy tracks I have a mixed opinion. The crunchy bass line on Strip The Soul (Porcupine Tree) sounded phenomenal – every note strong and noticeably accurate. With the M100MKII you'll be able to tell one distinct bass note from another unlike that overall voluminous hum that passes off for good bass these days. Having said that, I found the lows on Angel (Massive Attack) didn't In effect, it's not a brickbat against the M100MKII but just a defining trait of the bookshelf speaker category. The midrange was accurately represented as well. Overall, the HiVi M100MKII is an excellent option (much like the A2) if you are in the market for high fidelity desktop speakers. The audio precision they offer is not usually encountered.
