# Sony Xperia Z5

## The elegance of fallen grace

**T**he Sony Xperia Z5 is typically Sony – superlative build and design, with a dash of class. It stands for everything that Sony has been renowned for, which, also (unfortunately) includes devices that are good individually, but fail to justify their sky high prices in this massively competitive market.

To begin with, the Sony Xperia Z5 has been designed supremely well. Smooth, flowing design, an impeccable build with the buttons placed just right for one-handed usage, sealed flaps for water-proofing, frosted glass at the back and a brilliant IPS panel LCD display on the front. The frosted glass on the back looks really nice, and using glass in entirety but keeping fingerprints away is something that probably only Sony can do.

Coming back to the display, the 5.2-inch LCD display, with a resolution of 1080x1920 pixels, is one of the best out there today. Sony's knowledge of producing excellent televisions has trickled down to its flagship smartphone, and what you get here is a display that has sharp, crisp colours, a marginally warm overtone, fluid operations and brilliant touch response – all of which combine to make movie-watching and gaming a joyous affair. To add perspective, put a 2K resolution display beside it, and the Xperia Z5 will easily put it to shame.

This, in turn, brings us to three aspects – performance, battery life and audio. Powered by the infamous Qualcomm Snapdragon 810 chipset, the Sony Xperia Z5 is a beast when it comes to daily tasks as calling, messaging, browsing, IMs, and streaming music. You can also throw in a few photographs into the mix, and the Xperia Z5 is a steady, fluid performer, without any sharp spike in processor temperature. However, play games, and the maximum that the Xperia Z5 will endure is about 20 minutes without stuttering. The Snapdragon 810 heats up massively when you play hard, and we saw a temperature spike from 31 degree Celsius to 49 degree Celsius, within 10 minutes of playing Modern Combat 5. Seeing that no other 'premium' flagship smartphone faces a similar issue, it is a major factor to consider.

That said, the Xperia Z5 is a fine, fluid performer otherwise, and Sony seems to have addressed some of its issues that rendered the previous Xperia Z3+ unusable. Talking of audio, the DSEE HX audio engine and Sony's LDAC technology come together to produce stellar audio quality. The dual-speaker

stereo setup churns out audio that is way better than any other smartphone out there, and if you happen to be enjoying a evening with a friend at your place, the Xperia Z5 can act as a worthy portable speaker.

Moving ahead to its battery life, this is not the strongest battery stamina around. The 2900mAh battery pack will last you for about 7 hours of intensive usage, and barely the entire duration of a working day, on lenient terms. Hence, you'll always need a portable charger.

This leaves the camera – the stellar Exmor RS multi-aspect sensor, that actually goes higher than the 23 megapixels that the camera renders after pillarboxing. On paper, the camera is a world-beater. In real life, it isn't as fast as advertised (0.03 seconds?), images appear oversaturated in most lighting conditions, and renders unnatural colours and skin tones. Noise reduction is not its forte, and images appear soft as a result. Switch to Manual and tweak the settings, and then, some of the images that you get really define its class.

While the Sony Xperia Z5 is a class-leader in a few aspects, its overall performance does not put Sony at the helm.
