Nexus 6P

The flagship Nexus smartphone!

Huawei has gone all out with the build of the Nexus 6P. The smartphone has an aluminium body that makes it feel very premium. The device is big too so one-handed operation takes some getting used to. Because the smartphone is wide, it's a breeze typing on the keyboard. The 6P was constructed for two-handed operation and that's where it shines.

The rear of the smartphone has the traditional Nexus branding above which lies the fingerprint sensor called Nexus Imprint. Above the fingerprint sensor we have the bulge for the camera. The camera housing that bulges is almost negligible. In fact the bulge is just the right amount to identify, which side is the top of the smartphone without looking at it and that's a good thing.

Overall the smartphone has a slim and elegant design and its build is good too. The only downside is that the phone is a little big to keep in the average jeans pocket.

The display of the smartphone is crisp and very clear. Whatever you do on the device be it play games, watch YouTube videos, movies, read a book, the display is as good if not better than the one we have seen on the Samsung Galaxy S6.

One of the things we love about a Nexus smartphone is the stock Android UI and that's what we have here – Android 6.0 Marshmallow. You now have vertical scrolling for the apps listing. At the top of the app listing you have four apps that change based on your usage. So for example if you open YouTube, Facebook and WhatsApp first thing in the morning, then these apps will be at the top of the app listing.

Coming to the battery life of the smartphone, here is where we faced a bit of a hiccup. Android M boasts of the ability to consume minimum battery when the smartphone is kept idle. Sometimes this worked and sometimes there was a drastic dip in battery life (more than 25%) when it was idle all

₹39,999

night. It is possible that this happened due to background app downloads but the problem was present. Another inconsistency with the battery life was its overall performance. During some heavy days of use the smartphone really performed and was alive till the end of the day. At other times, the device was idle for most of the day and reached 20% battery level by night. It is possible that the battery in the unit we received was faulty but overall the battery performance of the smartphone is average at best.

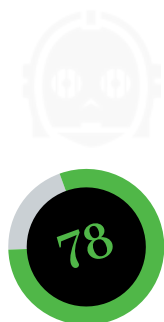

Moving to the performance of the smartphone, be it gaming, browsing the Internet, YouTube, etc. the phone worked very well. Coming to Nexus Imprint on the Nexus 6P, the fingerprint sensor just works. We recommend that during calibration

you put your finger in the most awkward positions. This will ensure that even when you touch the fingerprint sensor slightly off, it will recognise your fingerprint and work. The fingerprint recognition is really fast too – just touch it and you are directed to the home screen in a heartbeat. The location of the fingerprint sensor too is convenient – at the back of the Nexus 6P below the camera. Its right where your forefinger would naturally go making the task of unlocking the device feel very natural.

The camera of the Nexus 6P isn't the best in the market. We have devices such as the iPhone 6s Plus and the Samsung Galaxy Note 5 that hold this position. But that doesn't mean that the camera on the 6P is bad by any measure. It produces

If you are one looking to pick up a flagship smartphone with stock Android then by all means, go ahead and pick up the Nexus 6P. The device has impeccable performance, a great camera, vibrant display and a good build. Where it lacks is with its size. It's too big for one-handed operations. Other than that this is one smartphone that deserves the title – Flagship stock Android smartphone.
