

## UNRAVELLING THE MARSHMALLOW MYSTERY

Move over Lollipop, Marshmallow is finally here. And it tastes good! For, with this latest OS update for Android, Google seems to have decided to hand over the reins of power to the user instead of sticking to its usual spoon feeding formula. So you can now tinker around with your device and make it look and work the way you'd like it to. Instead of focusing on the UI changes this time around, the update offers more options in the settings, each guaranteed to make your life simpler as well as more secure. Let us take a quick look at the magic Marshmallow lets you create by means of a few tricks within the settings:

### Google Now on Tap

Google has introduced a new feature called 'Google Now' which is exclusive to Marshmallow devices. Thanks to it, search is now literally just a tap away. To enable this feature, all you have to do is head over to the settings of your Google App, tap on 'Voice' and enable the 'Now on Tap' option. Then, this feature can be availed of by simply long pressing the 'Home' button. Google Now launches as an overlay for your existing app and provides information based on keywords that it picks up rather intelligently from the active screen. For example, if your friend texts you a drop pin, all you need to do is to stay on the message screen and long press your home button to discover just how 'smart' your phone can be.

### Control individual app permissions

Ever felt like letting WhatsApp use your device contacts but

## Android 6.0 Marshmallow .....39

*Tips & Tricks has its own page numbers, and does not follow the rest of the magazine's page numbers. This is done to ensure that you can cut out and save T&T in a separate folder for later reference.*

having them stay hidden from Facebook? Marshmallow now lets you do all that and much more with the new App permissions setting. Either head over to Settings > Apps > App permissions, or modify the settings for individual apps. This also means that you can now choose what data any installed app can or cannot access on your device.

### Tune your System UI

Now this is one feature Google clearly does not want every Tom, Dick and Harry to exploit as

they've termed it highly experimental themselves. Basically, with Marshmallow, you can take customizing your device a couple of notches higher and play around with the system UI. So it's now possible to add or remove tiles from the quick settings panel, or even hide particular icons such as alarm or Bluetooth permanently from the status bar. However, there's a bit of trick involved to set these features in motion, making the whole deal even cooler. To activate the option, long press the settings icon (gear icon on the

Tune System UI

top right) in the quick settings panel until it begins to rotate. On releasing it, a success dialog box appears at the bottom. The option is then visible within the phone's settings.

### Treat metered connections like cellular

Tired of background data eating up your internet plan? Marshmallow brings you some good news in this regard – you can now treat metered connections as cellular. This means network restrictions, when enabled for specific connections, put a limit on background data of apps and also warn you before using these networks for heavy downloads. To get started, go to Settings > Data Usage, select 'Network Restrictions' from the '3dot' menu, and simply choose the connections on which you want the background data to be restricted.

### In-built File Manager

Android finally has its own usable inbuilt File Manager – a much-needed, highly awaited feature at long last. This is, again, not so easy to find. Once discovered, however, this should be greatly useful and convenient
