Apple to soon launch a service for mobile peer to peer payment service, just like Venmo from PayPal! <http://digit.in/iPayP2P>

Internet woes, games that don't save automatically, recurring BSODs and powerbank conundrums

Our readers are at it again but we've handled much worse!

Dysfunctional dongle

Dear Sir, Here's my PC configuration:

- OS - Windows 8.1 Pro (64 bit)
- CPU - Intel Core i3 - 4150 @ 3.50 GHz
- RAM - 8 GB Kingston HyperX DDR3 @ 1600 MHz
- HDD - 1 TB
- Motherboard - ASUS H81M-CS
- Dongle - Dlink CE0700

Each time I try to connect to the internet the dongle's software shows either of the following error messages:

1. connect failed. The PPP link control protocol was terminated.
2. connect failed. The specified port is not open

Please help me figure out the issue.

—M. Premananda Singh

A Well, it seems there could be more than one reason for this to happen. Firstly, we want you to check that you have sufficient balance in your internet account if this happens to be a pre-paid connection. If you do have enough balance then you might want to try fiddling around with the configuration settings. Follow these steps:

1. Open Control Panel and navigate to Network and Dial-up Connections.
2. Right-click on the dial-up networking connection associated with the dongle, and then click on Properties.
3. Click on the Networking tab, and then click on Settings.
4. This should bring up a window with three check-boxes. Clear the check box right next to Negotiate multi-link for single link connections.

Now, save the changes made to your network configuration and try reconnecting again. Hopefully, this should have resolved the problem. If not, go back to the connection and follow these steps.

1. Right-click on the connection, and then click on Properties.
 2. Click on the Security tab.
 3. Under Security options, click Allow unsecured password in the Validate my identity as follows box, and then click OK.
- If nothing works, consult your ISP.

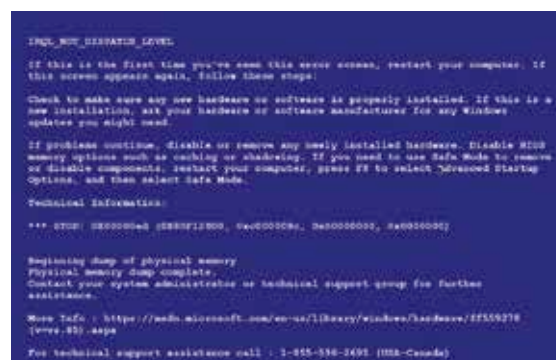

Blue Screen Of Death

Dear Digit, I am an avid reader and fan of digit and am writing this letter to asking for your help with my computer. These are my computer's specifications:

- Motherboard - Gigabyte GA-78LMT-S2PT
- RAM - Corsair Vengeance 1x 4 GB 1600 MHz
- HDD - WD Green WD10EZRX
- PSU - Corsair VS650
- Graphic card - ASUS AMD HD5450

Suddenly, one day while I was gaming my computer screen turned blue and a screen saying 'Dumping physical memory' started showing and the computer shut down. Afterwards, when I tried booting it up, it did not start at all. Please tell me what to do without formatting the system as the data stored on it is very precious.

—Anurag Chittawar

Analyse the minidump to know what exactly caused the crash. Be in the dark no more! More power to you.

A Thanks for writing in Anurag. The sequence of errors mentioned can be the result of any number of factors which is why it is important to analyse the memory dump to get to the root of the problem. Get your hands on a Linux LIVE USB stick and boot your system up. Navigate to C:/Windows/Minidump to find all the memory dumps and copy them onto the USB flash drive. Once that's done, go to any website that offers free memory dump analysis and upload your dump according to their instructions. You should get the appropriate reason as to why your system crashed.

Start off by replacing the BIOS battery. If that doesn't do the trick then your memory dump analysis should point the finger at some software or service. Using an Windows Installation Media, try repairing the OS. If that doesn't help then you might as well start backing up all your files using the Linux LIVE USB stick and then go in for a fresh installation. Also, check the HDD for any bad sectors while you're at it and get it replaced if there are any.

Permadeath problem

Hi Team Digit, I need your help. I recently got Assassin's Creed Black Flag and it

works smoothly. But it doesn't load the saved game. I have only completed one per cent of the entire game play so I didn't lose much progress. But with this issue, how do I play?

—David Abel Xavier

A This is a very common problem with Assassin's Creed Black Flag and the solution is pretty straight forward. Navigate to the installation directory and find the execut-
