Q&A

Disable Cloud save to solve the issue

able for the game which should be AC4BFSP.exe. Right-click on the file and click on Properties. Under the Compatibility tab check the box next to Run this program as an Administrator and click on OK. Check if the save game functionality works as designed. If not, simply disable Uplay Save by opening up Uplay and clicking on the little gear icon in the top-right corner. Uncheck the box next to Enable Cloud Save Synchronisation for supported games and then click on SAVE. Hopefully, this should solve the problem. If not, then navigate to C:\Program Files (x86)\Ubisoft\Ubisoft Game Launcher\savegames\randomnumbers\437 and you should find two files – save.DELETED and save.metadata.DELETED. Remove the .DELETED part from the end of both files and load up the game. You might have to do this each time you play the game.

Variable voltage

Hello, I recently bought a Honor 13,000 mAh powerbank, Model No AP007. I have the following queries regarding this power bank. I want to charge my Asus Zenfone 2 using this power bank. The charger that came with my Zenfone Has the following Output Specifications:- 5.2 V 1.35 A. Whereas the Power Bank Output is 5V 2A. So can I charge my Zenfone 2 with the Honor powerbank safely? I have this concern due to different voltages from my charger and the power bank. I do not want to damage my phone because of such issues. Please guide me whether it is safe to use the Honor AP007 13,000 mAh power bank with my Zenfone 2. Also, please write an article demystifying powerbank voltages, interoperability, etc. Thanks.

–Jatin Wani

A Hey Jatin, you shouldn't worry about this since all phones come with improved

circuitry that can handle a voltage range around the vicinity of 5 volts without any issue. In fact, very few chargers are actually capable of providing 5 volts exactly. There are some variations or the other and the phone's charging circuitry is designed to handle such minor variations. So yes, you can safely charge your Zenfone 2 using this powerbank. Thanks for your suggestion, we're on it!

Crash, run, repeat!

Hey Digit, I'm an average computer user with 2 GB RAM, Intel HD graphics, Intel Pentium processor, Windows 7 32-bit and Asus P5KPL AMP/S motherboard. In my computer, whenever I open more than 4 or 5 applications my PC crashes and when I

Minor variations in voltage levels shouldn't be a concern.

play games it crashes within 9 or 10 minutes. Please suggest a remedy for it.

–R. Narayan

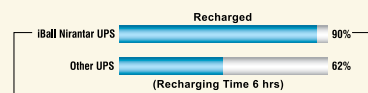

A If your PC keeps crashing then you should start off by analysing the Minidump. We've already elaborated upon that in an earlier query in this section. That should give you a direction to move in. Other than that, it seems this could be a heating issue. Remove the heatsink from your CPU and reseal it and apply a new layer of thermal paste while you're at it. While you haven't mentioned which applications you are running, we aren't confident at pointing the finger at your low RAM capacity. Newer titles of GTA and NFS require quite a lot of RAM and they'll crash owing to the reduced capacity. So analyse the Minidump, check the CPU temperature to figure out if you need to reseal the processor and consider getting an extra stick of RAM. **T**

RICHARD MAY NOT **BE READY** BUT
iBALL **NIRANTAR UPS** RECHARGES
33% FASTER THAN ANY
STANDARD UPS

Express Recharge.
High Performance.

iBall Nirantar UPS
bali NO LOSS. BOSS!

Only iBall Nirantar UPS gives you that extra backup facility
(Faster recharging makes it ready for extra backup in less time)
