The 2Ku in-flight WiFi

The next generation of in-flight WiFi is coming! Gogo to launch it next year. Read all here: <http://dgit.in/gogowifi>

Agent 001

A desktop upgrade

Dear Team Digit, First of all a very very happy Diwali to the Digit Team. I am a big fan of your awesome magazine. My system's configuration is:

- Motherboard - GIGABYTE
- HDD - 160 GB
- RAM - 8 GB
- GPU - NVIDIA GeForce GT210 1 GB DDR3
- PSU - 350 WATT Mercury brand
- PROCESSOR - Intel Pentium Processor

I want to upgrade my desktop's GPU and HDD. My GPU budget is around ₹5,000 - ₹6,000. So could you suggest a good graphics card so I could play the latest PC games like Assassin's Creed Unity and Syndicate, COD Advanced Warfare, COD Black Ops 3, Witcher 3, etc., at medium-to-high settings. Thanks in advance.

- Ratnapratim choudhury

A Hey Ratnapratim, the configuration you've listed does very little to shed light on what's in your computer since you've listed brands rather than the specific model numbers. But having looked at the remaining components, it's easy to say that your machine is far from being capable of running current AAA games at medium-to-high settings. Even a graphics card that costs ₹5,000-6,000 will not be able to run these games at medium settings, let alone high. So we'd ask you to prioritise getting an upgrade overall if gaming is what you wish to do primarily with this computer. Take a look at the Killer Rigs section within the magazine to get an idea of what you can get within a certain budget and go with that.

Gaming cabinet desires

Hey guys, I would like to buy a gaming cabinet and I've narrowed my options down to these two cabinets:

- CoolerMaster K281
- Antec GX 900
- My current PC configuration is as follows:
- Motherboard - Asus M5A97
- Graphics card - Sapphire 7770 GHz Edition
- Processor - AMD FX 8350 Black Edition
- RAM - Corsair Vengeance 8 GB
- SMPS - Corsair VS550

What in your opinion is the better cabinet? What if I go for the CoolerMaster K281 based on cost because in 4 years from now I'd like to add another graphics card in CrossFireX. Or should I go for the Antec GX900. And which cooling fan is best because these cabinets have options for mounting five fans. Currently I'm using some normal iBall cabinet and when I play games like Shadow of Mordor my system freezes, with a few blue screens popping up every now and then the processor temperature rises annoyingly fast, which is my serious concern. Please help.

- Neeraj Kamal

A The two cabinets are quite similar to each other across a lot of aspects. The cut-outs on the main panel and the front I/O panel have the same set of options. So your decision could come down to the fact that the GX900 has five fan mounts and cooling is what you're primarily interested in. The GPU clearance is also very similar with a difference of just five millimeters between the two and both can handle multi-GPU configurations. As for cooling fans, you can't go wrong with Noctua. They are silent and are capable of maintaining high static pressure depending on the fan model.

A thin laptop

Dear Team Digit, I was hoping you would help me out with options about which laptop to buy.

Requirements: light weight, okay with a screen size of 13 inches if that means I can cart it around easily, conveniently, and without any fuss. Apart from ultraportability, another important aspect from a usage perspective that I will primarily be using this machine to use design software like Adobe InDesign and photo editing, video editing tools to from time to time. So it should be able to handle that workload, if the need arises.

I have no brand preferences

Budget: ₹55k.

Do you have anything for me? Thanks in advance for all your help!

- Yolande

A After carefully considering your needs and wants and the budget at your

disposal, here's what I think: The ASUS UX305 FA is a worthy machine to buy, largely for ultraportability – not so much for its CPU / GPU performance, to be honest with you.

May I suggest the MacBook Air? The price of this machine will definitely go down come special holiday season deals and discount season (re: Christmas and New Year's)... near the ₹52k mark, I think.

Its onboard graphics is much better than the ASUS', and having used a MacBook Air myself, I can vouch for its performance to be better than the ASUS'.

Unfortunately, I haven't really tested many lightweight notebooks at that price point to be able to share other recommendations with 100% certainty.

A budget smartphone

Hi Agent 001, I urgently need to recommend a couple of family members a cheap and reliable smartphone between the ₹5k to ₹8k mark. Please help me decide the right candidates, if there are more than one recommendations that you're making. Thanks a lot for your guidance.

- Ishvar Mayawi

A Since the launch of the Moto G 3rd gen, Zenfone 2 and Xiaomi Mi 4i the competitive smartphone market has come down around the Rs. 10K range. But if you only have a 7K budget for a Smartphone, these should be your picks.

Meizu M2 is the younger brother of the Meizu M2 Note which was launched earlier. The phone features a similar design that's wrapped around a smaller 5-inch display. The display is a quite good and has a 720p HD panel. It is powered by a quad-core MediaTek SoC with 2GB of RAM. It also comes with 16GB of on-board storage which can be expanded up to 128GB via a microSD card. There is a 13MP camera at the back with a 5MP front camera and both are equally good.

Another phone that falls into the sub-7K category is the Yu Yunique. Priced at ₹4,999, the phone is the one to choose if you are looking for phones under the sub-5K price mark.

Just stick to these two recommendations for now.
