Feel like smartening up your home? Learn how to switch your home appliances on / off remotely using Arduino.

**One ring to rule them all?**

Forget the smartwatches, here's a smart ring to control mobile devices remotely via bluetooth! <http://dgit.in/FinWrblRng>

Mad, madder, **MADDEST!**

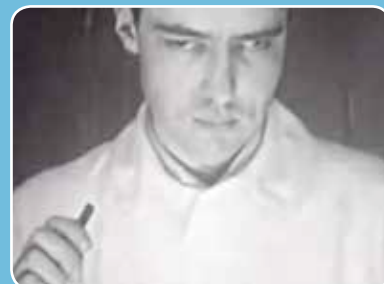

While science is undoubtedly the guiding light of our civilisation, it too is wrought with individuals who pushed the envelope a little too much and indulged in Frankensteinian science or worse. Here are some of the maddest of the lot.

**Andrew Ure**

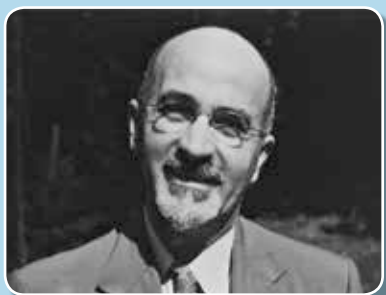

Bioelectromagnetism i.e. the science that started off with physicists zapping dead animals to study electrical patterns of the nervous systems had quite a few pioneers. But Andrew Ure wasn't satisfied with just animals so he got himself an executed killer and proceeded to stick electrodes in all places. What followed was best described as the first ever horror show.

Johann Conrad Dippel

Having been born at Castle Frankenstein, Johann Conrad Dippel literally dabbled in Frankensteinian science as he went about putrifying human and animal remains in his search for *The Panacea* (the mythical cure-all potion). What he got after distilling a bunch of animal bones was one of the foulest-smelling concoction known to man – Dippel's Oil.

**Dr. Robert E. Cornish**

Perhaps the only guy who actually succeeded in bringing someone back to life, Dr. Robert E. Cornish was a child prodigy who graduated at 18 and got his doctorate at 22. His experiments with two dogs which basically had them strapped to a see-saw and pumped with steroids minutes after death were successful. Alas! He couldn't get fresh human subjects for his experiments.

**Walter Freeman**

António Egas Moniz came up with lobotomy but Walter Freeman went to extreme lengths to popularise it. He'd prescribe lobotomy to almost everyone and his procedures had a success rate of forty per cent. The remaining sixty per cent were rendered with reduced intelligence or worse...comatose. Among his victims was Rose Marie Kennedy, JFK's sister.

Paracelsus

Philip Theophrastus Bombast von Hohenheim was a man of principle! In an age where doctors would dictate rather than performing procedures themselves, he believed in a more hands-on experience. What's weird was his method to create a homunculus, i.e. human made through alchemy. Just mix human male gametes with horse dung and let it rot for 40 days.

**Shiro Ishii**

How do you test the efficacy of biological weapons? By testing them on humans of course, and then vivisectioning them while they were still alive. Led by Shiro Ishii, Unit 731 was a Japanese research division which has no known survivors. What's worse is that all the knowledge gained was bartered for complete immunity. The effects of their experiments are still visible to this day.
