

InFocus Kangaroo

The size of computers are drastically falling and we already have them in the form factor close to a pen drive. The major disadvantage of these PC-on-a-stick is fewer number of USB ports to connect more devices. InFocus believes that they have found the solution to this problem through the Kangaroo, a smartphone-sized portable PC running Windows 10. This device has a clever solution to fewer ports with its detachable dock housing an HDMI port along with two other USB ports (1 USB 2.0 and 1 USB 3.0). It isn't a powerful computer which is running on an Intel x5 processor but will surely get you through with regular work for up to four hours. The Kangaroo is priced at around ₹6,500 which is a steal considering the other competitors and the specs this device offers.

SPECIFICATIONS

Processor: Intel x5-Z8500 | **RAM:** 2GB LPDDR3 | **Storage:** 32GB eMMC | **Expansion:** MicroSD slot | **Security:** Fingerprint scanner | **Weight:** 200g

DJI Osmo

Selfie sticks are moving on to become old school where everyone and their grandma has one. Offering a way stronger offshoot to a selfie stick, you should be looking forward to DJI's new product, the Osmo. For starters, this isn't a selfie stick but much better than that. Mounted on a 3-axis gimbal stabiliser, the camera is capable of shooting 4K videos in 60 frames per second and full HD videos in 120 frames per second. The gimbal on this device seems like a downscaled version of the same present on the Phantom 3 Professional drone. You'll still require a smartphone to act as the viewfinder of the camera and also to access the various internal settings of the camera. The Osmo also sports physical buttons for basic functionality such as a record button and to change modes for the gimbal. It would have been interesting if the camera module was replaceable or better if the gimbal had a mechanism to hold a smartphone.

SPECIFICATIONS

Camera Sensor: Sony Exmor R CMOS, 12.4 MP | **ISO Range:** 100-3200 (video), 100-1600 (photo) | **Video Resolution:** 4K (3840 x 2160) up to 30p, FHD (1920 x 1080) up to 120p | **Storage:** MicroSD card slot up to 64 GB | **Battery:** Li-Po 980mAh | **Weight:** 201 g

Philips Hue

White and yellow just doesn't cut it anymore. To save us from this mediocrity, Philips with their Hue series of LED light bulbs let you change colours at will. We received the regular Hue series of 9W LED light bulbs and effortlessly set them up across our office space. The best location to place the bulbs, hands-down, was behind one of our test TVs, setting up an elegant mood for the room. The colours are controlled using their own app with a range of 16 million colours which we can't possibly experience in one lifetime. The app also lets you pick colours from your environment – a feature useful when you're setting up the lighting according to your date's evening attire. The colours can be changed on the fly and can also be dimmed down, with hardly any visible latency between operating the light and the app. Things got really interesting after we integrated the bulbs with IFTTT. Overall a lot of fun.
