Feature

platform, still has to pay the same price for usable data as the rest of the population to access the entire internet. Now, if some of the things he accesses become free of cost, he just pays a lesser amount to access the same internet. It need not be retold how this benefits the low income class of India. The two ideologies of net neutrality and the speedy adoption of internet cannot practically go hand in hand. If the private sector is to be entrusted with the noble endeavour of getting online the 700 million strong still unconnected populace certain innovative measures that don't outright violate network neutrality have to be adopted. Similarly, Facebook's Internet.org achieves efficient price discrimination, not quite unlike Satellite TV operators providing channel packs at lower costs based on what the user watches.

Coming to the technical side of Zero rating, it has been established by observation and several studies that the quality of a network increases with

an increase in the number of users. To continue with the Highway example, ask yourself where should you build a six-lane highway: a road actually suffering congestion or somewhere desolate where it might not be utilized fully?

Numbers are good, so is competition

The Internet is a two sided market. A greater number of users encourage content providers and app developers to expand and reinvent their services. Simultaneously, a diverse and expansive range of content which is easier to access attracts more subscribers to the internet. In short, the more the netizens, the more the variety of content available.

Along with that massive usage, something like Internet.org will also create a healthy competition between networks, where the end user stands to gain. This ultimately reinforces the belief that some internet is better than no internet.

The Golden rule of Internet: Think before you speak, or be trolled

Violation of net neutrality is not acceptable in any form and its opposition to any extent possible is justified. The part where such an opposition becomes harmful is when it relies on misinformation and herd mentality to reach a decision without really getting to know the essence of the matter.

We have rightfully opposed Facebook and Airtel for their misguided endeavours, considering that they are both massive corporations who cannot assure us that their 'free' services won't turn into monopolies and bite us back in near future. But what is also true, is that instead of being told what they are trying to achieve by the advocates of one side, perhaps we should consider both the sides, find a balance and then make a decision.

Or maybe we'd rather get trolled.
