RAW vs JPEG

Reuters banned the submission of RAW format photos to ensure the reality of the images taken. <http://dgit.in/NoRAWpics>

IS THERE A HIDDEN DEEP WEB?

Now that the Deep Web has surfaced in public discussions, the biggest question is how many levels does the Internet have? Well, if you have to get at the truth, then you need to dig deep. And here is what experts have found:

- A. Layer 1:** This is the one we are all familiar with, and use everyday. The links are decisively Internet-facing and access is easily possible with popular browsers.
- B. Layer 2:** Below the primary layer a multitude of Internet-facing links exist, though they are unlisted. The major mode of accessing these links is through enforced anonymity.
- C. Layer 3:** This is huge agglomeration of links that aren't Internet-facing. Most of the content in this layer isn't accessible to the casual user, and access methods include using physical networked devices or specialized software.
- D. Layer 4:** This layer involves smaller networks, none of which is Internet-facing. Usually, the highly protected content of this layer can only be accessed via security flaws.

Depending on who you ask, the number of layers and the contents thereof could vary. But, It has often been speculated that that there are hidden areas within the DeepWeb that are accessible only to a select few.

1. Marianas Web

While there is no proof, belief has it that the Marianas Web is a repository of all secrets

that humans have pondered about for long time—including the actual location of the lost city of Atlantis and the Vatican secret archives. But that's not all. Some conspiracy theorists claim that the Marianas Web is an AI (Artificial Intelligence) that has become sentient, and now controls the whole

Internet. According to the proponents of this view, you need quantum computers to access Marianas Web.

2. Freenet

Unlike Marianas Web, Freenet isn't a myth. It's a platform that allows you to communicate anonymously. Aimed at aiding those who wish to beat surveillance and use the internet

for publishing information without revealing their identity, Freenet has been around for about 15 years and is quite popular among whistleblowers. But a few allege that Freenet helps you gain access to the darker parts of the web, and dabble in shady activities in complete anonymity.

forgers, pornography –and plenty of other stuff you wouldn't feel comfortable discussing with your mother. Be warned that Onionland also has its own share of scams—all designed to make you part with your hard-earned money. Onionland, with its perennially shifting links and directory entries, is characteristic of how many Darknets function.

Deep Web is more of a Temporary Haven

It's alarming to think that so many products and services that we rely on are controlled by a few powerful organizations, including the government. The common man has put quite a lot of trust in these organizations. Unfortunately, these mammoth entities exert a high

level of control over most mainstream media. So, when a malpractice arises, it is more than likely that it will go unreported. This volatile situation has made whistleblowers extremely crucial for the world at large—and has rendered them highly vulnerable to punitive action.

While whistleblowers have found a way to protect themselves by making use of the Deep Web and other anonymity-providing services, in the long run it is not feasible to rely solely on the Deep Web for protection. Given the rate of evolution of technology, surveillance agencies will eventually breach them. What we need are stringent rules and laws to protect those who risk everything to divulge a significant piece of information—and strong enforcement. New initiatives like the Whistleblowing International Network (collective of NGOs for whistleblowers) that strives for better protection for the secret-breakers need to be encouraged and supported.
