More and more first-time users of technology are experiencing the Internet, online services, digital communication, and some of the other privileges we take for granted, through smartphones. And unlike desktop PC users who are already aware of having a security suite installed on their Windows PC, smartphone

users are largely unaware of the threats persisting online, and the fundamental need for security solutions for their smartphones or tablets. Through this short comparison, we try to bridge this knowledge gap.

You just have to try googling for "smartphone malware" and the number of alarming news reports from respectable media sources and private security firms commenting on the rising trend of smartphone malware is evidence of the malaise gripping the smart-

phone industry. Every other week, reports of a new Android malware affecting hundreds of thousands (if not millions of) devices is common place. At stake is not only your sensitive data but other financial information, not to mention your personal identity, if you don't take preventive steps to minimize risks and avert disaster.

What choice do consumers have? Apart from inculcating safe browsing habits, you should install a mobile security app on your phone. We

tested three of them in this comparison. What we found is apart from safeguarding us against unwanted malware or digital snoops trying to steal our private data stored on our mobile devices, these security apps offer a lot more. From optimizing your device to protecting your web browsing session, parental controls to saving your passwords in encrypted format, mobile security apps are getting more versatile to appeal to a vast swathe of consumers. Let's see how they stack up.
