Facebook now lets you limit or hide completely what you want to see of your ex partner after a breakup! <http://dgit.in/FbBrkup>

**PERFORMANCE****NORTON**

During our scans, Norton performed best by detecting almost everything we threw at it almost instantaneously. A full scan took about 25 seconds but seemed to scan only apk files even though the parameter was set to include SD card for scanning as well. During the tests for web protection, it detected the malicious website itself and blocked it which others failed to do so. Credits to the Norton community? Except for the first test on that website, it did block all the others. Parental controls can be added onto with installation of the Norton family app which in itself is really strong when it comes to protection and control. What disappointed us was that Norton even after clearing our web protection with maximum points, did not block spam banners and ads on the websites. During all this activity, it consumed about 160MB when running in the foreground and performing scans and around 50MB when running in the background. Quite light on resources we must say.

Performance

Price.....	₹580
Wicar Test Score.....	11
Battery Consumption.....	2%
Foreground RAM.....	160 MB
Background RAM.....	50 MB

KASPERSKY

In our comparison, Kaspersky was the only contender to offer options of Quick scan, Full scan and a Folder scan. In our tests, on an average, Kaspersky took 41 seconds to do a quick scan of all apps whereas a full scan took about 9 minutes and 30 seconds. It was quite thorough as far as client-side scanning was concerned.

However, in spite of having various options, it failed to offer the ability to scan a single app. In our browsing test, quite surprisingly it failed to block any of the harmful websites and packages we downloaded which were marked malicious by other softwares in the comparison. On the whole, except for the scanning, we couldn't see Kaspersky 'Internet security' performing what it was supposed to. It was quite thorough when it scanned for files and was also relatively low on RAM usage when the app ran in the foreground – which is especially good news, considering if you're running this on a sub-10k smartphone.

Performance

Price.....	₹599
Wicar Test Score.....	0
Battery Consumption.....	2%
Foreground RAM.....	110 MB
Background RAM.....	83 MB

TREND MICRO

In the primary scans, by default the Trend Micro app scans just for malware or harmful or infected apps – nothing more, nothing less. You have to manually go to the settings and switch on scanning for the SD card so it scans all the files on your phone. By default an automatic full phone scan would have been better.

In safe browsing test, it performed quite well blocking almost all malicious links but failed to trap the ad banners or pages that display spam pop-ups. If parental controls are set well, it does block unsuitable websites that are suppose to be blocked – we did scratch our heads as to why this wasn't enabled by default. During our testing, its RAM consumption during full phone scanning was above 200MB every single time whereas once the app was stopped and just ran in the background, it was the app that consumed just about 20MB at any time. Quite a resource hog, we must say. Not desirable.

Performance

Price.....	₹349
Wicar Test Score.....	9
Battery Consumption.....	5%
Foreground RAM.....	222 MB
Background RAM.....	18 MB

HOW WE TESTED**Initial setup:**

All security apps to be tested are first examined for supported system requirements. We only tested out the mobile versions of the antiviruses. So for testing we selected the iPhone 4S running on iOS 9.1 and OnePlus 2 running on modified Android 5.1 Lollipop as the two comparison models. We then setup the required devices on which the antiviruses are to be tested, as per the company specifics on which the antivirus apps are downloaded and installed. We also installed any company released update and test the new fixes available.

Performance tests:

We conducted a whole series of real world tests on the devices to measure the impact of every aspect of the antiviruses on overall performance. These tests include scan time tracking by a stopwatch, battery & RAM consumption (both foreground and background monitoring) from internal resource monitors for 15 days. We conducted Wicar's test, which is a Windows based test on the mobile devices for real-time protection testing. In this test we downloaded malware payloads to the devices to test if the antivirus blocks it or not. Results were carefully catalogued. The final performance score is the weighted sum of all the scores catalogued. Weights are assigned based on the perceived importance of every aspect of the app's performance.
