

tionally, hit S key for search and G for guide. Sadly, like TV you cannot use your phone to search faster and queue videos.

Try advanced keyword searching

Apart from the straightforward basic search queries YouTube supports some advanced search options to get you closer to your results. This comes handy when you want to find a video but don't remember the exact title. In such case you can search using keywords. To do this, type "allintitle:keyword1 keyword2". For example, search for "allintitle:coldplay thrones". This will return all the results having the keywords "Coldplay" and "Thrones" in the title.

You can also search for videos that do not have a specific keyword. To do this, type "your search query -keyword" For example, search for "rainbow six siege -xbox one". This will return all the Rainbow Six Siege videos filtering the videos related to Xbox One.

Watch YouTube videos while using other sites

Most of us wish to watch YouTube while using other sites. Sort of like a picture-in-picture mode which is common in quite a few high-end televisions. While this feature is not officially offered by YouTube you can get this feature with a Chrome extension called "Floating for YouTube" from <http://dgit.in/FloatYT>

After adding it to Chrome you'll see a "pin" button on hovering over the video thumbnails. Additionally, the default YouTube player also shows "pin" button at the bottom corner. Click on it and the video will float in your browser. You can keep using other websites while the video plays in the corner.

Gets me the exact Game of Thrones video I am looking for.

Bypass age restriction without signing in

Restricted videos necessitate you to confirm your age by signing in before watching the video. Although this may not be a common issue, in case you encounter this error there are two ways by which you can bypass age restriction without signing in.

To do this, just replace "watch?v=" in the link with "v/". For example, rewrite this link "<https://www.youtube.com/watch?v=07FYdnEawAQ>" as "<https://www.youtube.com/v/07FYdnEawAQ>" to watch the video which was restricted for you earlier.

The second way in which you can bypass age restriction is by adding "nsfw" before "youtube.com". For example, this link "<https://www.nsfwyoutube.com/watch?v=07FYdnEawAQ>" will take you to a new site that will let you watch the age-restricted video.

The site offers a button called "Bypass YT login" which you can add as bookmark. It's a javascript that will bypass YouTube login on the official website. Thus, when you are asked to sign in just hit this bookmark and you'll see your video.

PHOTOSHOP

Photoshop has been the most handy tool when it comes to any photography hack for years. With a new version releasing every year, this super colossal photo

manipulating tool packs new features intended for the ease of use. We handpick some best tricks that will enhance the way you used Photoshop. Check them out.

Use the history states

By default the layer visibility cannot be altered using undo/redo. If you have tried to "Ctrl + Alt + Z" to undo the layer visibility, we are sure you have failed. Photoshop does offer this feature but is disabled by default. To enable this feature you need to tweak setting from the History panel. If you don't see History panel go to Window menu > enable "History". In the history panel, click on the submenu icon (located at the top-right corner) > History options > Check "Make layer visibility changes undoable".

Also we recommend you to increase your History states (by default: 20) to more. To do this go to, Edit menu > Preferences > General > Performance > History states. Change it from 20 to whatever you like. (max. 1000).

Quickly Export a layer

Exporting a single layer from your Photoshop Document was a painful task until Adobe released Photoshop Creative Cloud 2015. With Photoshop Creative Cloud 2015 this option is natively provided. In order to get quick export option first choose the desired export format by navigating to File > Export > Export preferences.

Once that is done, right-click on the layer you want to export and you'll see an option "Quick export as". Click on it, enter file name and you are done. Alternatively, you can quick export from File > Export > Quick Export as.
