Circle Gaming Adroit X7C

When you can't afford a gaming mechanical keyboard

Price
₹2,999

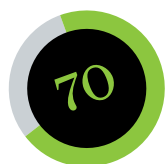

Circle Gaming's Adroit X7C follows such a hybrid design to ensure a considerable key travel and a mechanical feel to it. The design has a generic approach, making it reminiscent of other hybrid keyboards. The keyboard material has a matte soft touch finish so it's not susceptible to fingerprints. It has six multimedia keys at the top which is really helpful but no macro keys.

You can remove the keycaps, for cleaning purposes, but expect considerable resistance every time. The typing experience is indeed close to mechanical keyboards minus the satisfying click and short key travel.

The most exciting feature about the keyboard is its seven colour backlit mode supporting three levels of brightness and a breathing transition mode. The lighting doesn't need a software and it can be controlled from the keyboard itself using the dedicated button that lets you shift through the seven colours and toggle between the breathing and lit colour mode. Due to the white surface below the keys, the LED light look brighter, something followed in the Corsair STRAGE RGB. It also features 19 key anti-ghost which means that the keyboard will be able to register up to 19 specified key presses simultaneously.

Playing FPS games was a breeze with all key clicks registering. Overall, we think the Adroit X7C is suited for both gaming and typing, selling for a good price.

Samsung Galaxy S7

Incrementally improved

The Samsung Galaxy S7 is beaten by only one Android phone in the market today, the Galaxy S7 Edge, and that says a lot about the device, doesn't it? While the Galaxy S7's overall performance and camera quality remain the same, the major changes in the handset are visible in the design department. The Samsung Galaxy S7 is not as expensive as the Galaxy S7 Edge, but that doesn't stop it from being pretty much the same phone.

The curved back and smaller form factor, make the Samsung Galaxy S7 more ergonomic than the Edge. It's also easier to pick up off a table, because it doesn't have the Edge display on the front – thank heavens for that.

Price
₹48,900

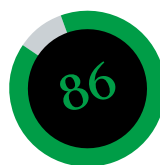

That said, the Samsung Galaxy S7 doesn't look as striking as the S7 Edge. It's the plain old Samsung design, but more solid than last year's Galaxy S6. Ah well, one can't everything, can we?

A smaller 5.1 inch QHD display allows the Galaxy S7 a 577 ppi pixel density. While this is higher than the 531 ppi on the S7 Edge, it makes no noticeable difference. For all intents and purposes, the Galaxy S7 has the same display as the Edge variant.

Sadly, the smaller display doesn't lead to higher battery life. The phone has a smaller battery as well, leading to the same battery life.

Overall, the Samsung Galaxy S7 is as good a phone as the S7 Edge. It's just not as good looking, and doesn't feel as premium and unique.
