Lenovo Zuk Z1

A job well done

In some ways, the Lenovo Zuk Z1 doesn't belong in the Indian smartphone market. It has a Snapdragon 801 SoC, which is outdated on paper. But this phone is more about the experience than the specifications. Its metallic frame goes well with the polished plastic back, making the phone quite premium. It is of course big, but you're probably going to buy this phone because you want a big device.

Its strongest suit is the display, and specifically, the colours. The 5.5 inch FHD display shows crisp colours, and that's just on auto mode. If you want cooler or warmer colours, CyanogenMod 12 allows you to tweak the display's colour temperature. You can even choose different colour temperatures for daytime and night time. The colour temperature settings doesn't work on presets either, instead there are sliders that you can use, for more granular control.

Lenovo has used the same panel that was used on the Vibe X3 smartphone. The maximum brightness can go up to 450 nits, which is fine, but the sunlight visibility isn't great.

Coming to the performance, CyanogenMod is tuned for the Snapdragon 801 on this device. As a result, the Lenovo Zuk Z1 performs better than a phone like the OnePlus One. It's not more powerful than the Xiaomi Redmi Note 3, but the performance is still great. Apps load really fast, as long as you're not playing very heavy games. Even then, while the loading time will be longer, gameplay doesn't show lags worth mentioning.

Temperature management is also well done. Even when the processor reaches 2.5GHz, the temperature rarely goes above 40 degrees, unless it is really being taxed. However, that still doesn't change the fact that the Snapdragon 801 is quite old. It's not outdated yet, but it isn't a 64-bit SoC either, which means its life cycle will soon be over. Even so, you should be fine with it, for at least a year.

Further, while the Lenovo Zuk Z1 runs on CyanogenMod 12, and by extension Android 5.1.1,

Price
₹13,499

Lenovo has promised the Marshmallow update in June. This will come with CyanogenMod 13. CM12 is the same as what we saw on the Yu Yutopia, but a striking difference is in the fact that the OS is much more stable on this device. Since the Zuk branded phones by Lenovo are meant for enthusiasts, the company also allows you to root it without voiding warranty.

CM12 has advanced settings turned on by default, which allows granular control over apps. The app permissions feature from Marshmallow is built into this phone. So, you can manually decide what apps get what permissions, instead of granting them all at the time of download.

Another good thing about the Zuk Z1 is that it has a 4100 mAh battery, which lasts quite long. On heavy usage, the phone was able to last for a full day with ease, and for lighter users, it can go up to a day and a half, or more. On the Geekbench 3 Battery Test, the phone lasts for just about 8 hours.

The weakest aspect of the Lenovo Zuk Z1 is its camera. The phone has a 13MP camera on the back, but it's not something worth appreciating. It can take good photos under bright sunlight, but lower the light and pictures deteriorate. Even in indoor conditions, images lose sharpness and details are somewhat lost. They are of course, worse under low light. Colours are acceptable across the board.

Overall, the Lenovo Zuk Z1 is a fine device. Yes, the Snapdragon 801 is a concern, and the camera is no better than what you find on the Redmi Note 3. In fact, we wouldn't even say that this phone is more powerful than the Xiaomi Redmi Note 3, but it is better than the Honor 5X or Lenovo Vibe K4 Note. It's a phone meant for the tinkerers, and those who like to try new ROMs on their phones. It's what many loved about the OnePlus One, and it's what we liked about the Zuk Z1, at a nearly 40% lower price (the OnePlus One was originally priced at ₹21,999).
