

GREED

EXAMINED

Really cool products come to the Digit Test Centre which don't really fit into the standard product categories that we review in the Bazaar section. We write about them here mostly to make you turn green with envy.

Motion sensor control

You can control the airflow speed of the purifier through three steps by swiping your hand over the panel. The panel also notifies you when it's time to change the filters.

Blueair friend app

The app connects to your purifier and gives information about the air quality inside and outside. You can also remotely check if your air purifier is working, check the room temperature, humidity and other sensor data.

Wide range of colours

Available in six different colour variants, the Sense+ gives you options to fit your preferences. The grille design ensures a wider airflow while maintaining a decent and wraparound design.

Blueair Sense+

Monitor the air quality inside your house from anywhere

The previous month we had received our first air purifier from Crusaders and we have more lined up at our test labs. This month, Blueair sent over the Sense+ that filters out particulate pollutants using the HEPASilentPlus filtration method, capable of blocking harmful particles down to the size of 0.1 micron. The added benefit of the Blueair Friend app gives you wireless connectivity to the purifier letting you control the airflow speeds and several other features. The app also shows you air quality data from more than 150 countries. Ideal for rooms under the size of 200 sq. ft., the purifier is capable of filtering out smoke, dust and pollen through the two particle filters with activated carbon filtration. It isn't power hungry as well, drawing in around 7W at the lowest fan speed while scaling to about 46W at its highest. All these features inside the purifier helps to keep the room's air quality pure at a price of ₹45,000.

To remove the filters you'll need to turn the device upside down and pull out the two filters using the handles. This way you could replace the particle filters when notified by the device. These handles have rubber padding that act as its feet when kept upright.
