

GREED

TAKE MY MONEY!

Here is where we keep an eye on crowd funded projects that will make you go 'Shut up and take my money!'

EYSE

3D cameras are the talk of the town right now, but many of these 3D cameras are just run of the mill cameras. EYSE is something entirely different. It's a Wi-Fi 3D camera but it brings a lot more to the table. This device comes with two 5MP cameras capable of recording dual-perspective video and broadcasting live feeds. So with a companion VR device you can transmit your sensory perception to someone else, like a 3D telepresence experience. You can also record videos and store them in an in-built storage of 16GB. The device is highly customisable with different covers and lenses. The designers have given durability a considerable thought. The device has a rugged design and the expensive variants are even waterproof. The EYSE can be mounted on any drone and any action cam without any hassle. As for the VR compatibility is concerned you can rest assured that the EYSE is compatible with most devices. EYSE supports Qi charging (wireless charging) and has GPS Tracking too. Phew!

F.lens

Flashlights are a pure necessity for us and the need can arise at any time, but is your smartphone's flashlight powerful enough? f.lens is the first ever flashlight booster accessory which will work with all major Apple devices and some selected Android devices. It's capable of boosting your device's in-built flash by 10 times as promised by the company and with that provide you with a tight focused flashlight. This product is compact and very easy to attach to the smartphone. F.lens is magnetic and attaches itself to the phone seamlessly. The design is quite premium and the device is features a full glass and aluminium construction. With f.lens your night pictures will be of comparatively better quality. F.lens collects the light emitted by the smartphone's integrated LED flash, and generates a brighter and tighter beam able to light up distant objects. We're eagerly awaiting an attachment that'll let you shoot high power lasers next!

Portal

Wi-Fi is almost ubiquitous these days but it isn't without its flaws. With Portal coming into the equation, the user's Wi-Fi experience will apparently be enhanced 300 times. The major cause of poor Wi-Fi connectivity is invisible traffic jams or what we call congestion on the network. Portal aims to overcome this problem with the help of "spectrum turbocharger technology" which apparently gives it access to 300% more of the radio airwaves than any other router. This device is capable of covering a range of approximately 2,500 sq. ft. Two Portals can be daisy-chained to extend range to 200 ft or more.
