

1 Fast Food workers

None of you might consider a career as a burger flipper, but those of you willing to do it whilst in school or college for pocket money might need to find a new option. Small restaurants might not be able to afford automation, but big chains will definitely

want to reduce headcounts. Machines are cheaper and make less mistakes. We expect perfectly cooked and mass made manufactured fast food.

2 Pilots and army grunts

Drones are already grabbing the headlines in warfare, and we expect this trend to continue. People are expensive – they need to be fed and protected in battle. When mass made, machines are cheaper, and with new technologies, they're getting smarter than ever before. Pretty soon, wars are going to be won by geeks piloting machines from far away, using virtual reality headsets.

3 Semiconductor technicians

Pretty soon the machines won't need us to make them. Well, at least in part. The thing with machines is that they're built with precision, and precision is what machines

also happen to be best at. Stands to reason that they will excel at building themselves.

4 Construction jobs

Again, this is a job that is pretty repetitive and requires precision. Now, architects are creative, and until machines get creative, those jobs are safe. However, everything from brick laying to mixing and pouring concrete, and even carpentry and electrical work is really a precision job that can be automated. Plus, pre-fabrication of homes and buildings (Ikea style) will also make this field perfect for automation.

5 Designers / average artists

We're not going as far as writing off skilled artists just yet, but we certainly think that automation (especially software-based) will make a designer irrelevant. This is already happening with so many apps and sites

being built by novices. Software will cut out the middle man, and give complete control to the creators. if you think this will result in ugly apps, sites and designs in general... you are probably a designer, and our sympathies for your upcoming redundancy!

6 Retail clerks

This one is a no-brainer if you've been abroad to a first world country. Self-service is the name of the game, and retail have only skeleton staff. Sure, your corner shop isn't going to invest in self-checkout machines, but then between online shopping giants and large retail chains, the days for the corner shop are numbered anyway. You hate it now, but soon you will miss the person walking up to you going, "May I help you".

15 JOBS THAT WILL BE OBSOLETE IN THE NEXT 15 YEARS

THE JOBS FOR WHICH 'JOB-GUARANTEE' IS JUST NOT A PHRASE THAT'S APPLICABLE!
